From the collection of:

Mike Jackson, FAIA

PLEASE NOTE

This copy of Sweet's Architectural Catalogue is loaned for reference purposes, with the understanding that it is to be returned upon publication of the next annual edition.

In order that the distribution list may be accurately kept, users of SWEET'S are urged to notify the publishers promptly of all changes in firm name, firm address, or the name or position of the person who is making use of this book.

INFORMATION SERVICE

Users of SWEET'S are invited to write for information concerning any special class or make of building materials or equipment. We have on file detailed information concerning the products of the principal manufacturers of building materials, power plant equipment and allied lines.

If you notice the omission of the catalogue of a firm in whose products you are interested, or find that any of the catalogues herein contained are lacking in the specific data required, you are requested to advise both them and us of the deficiency. Such co-operation will be helpful in making subsequent editions increasingly comprehensive.

Address inquiries to our New York office:

SWEET'S CATALOGUE SERVICE,
119 West 40th Street, New York, N. Y.

HAMILTON MANUFACTURING CO.

Manufacturers of Drafting Room Furniture

MAIN OFFICE AND FACTORY

TWO RIVERS, WIS.

EASTERN BRANCH AND WAREHOUSE, RAHWAY, N. J.

Products

OAK AND STEEL BLUE PRINT SECTIONAL CABINETS; ADJUSTABLE DRAWING TABLES; DRAWING BOARDS.

Also manufacturers of Collapsible Drawing Tables and Easels, Parallel Rule Attachments, Artists' Tables, Typewriter Tables, School Tables, etc.

Blue Print Sectional Cabinets in Wood

Built on the unit plan—add as requirements demand. Thoroughly well made of seasoned oak and well finished. Each drawer

is fitted with label holder, substantial pulls, and hood at back of the drawer.

Sizes—Carried in stock in two sizes. Units lettered from A to P and numbered 32 and 37.

No. 32 Units—Have drawers with inside dimensions 32x42½ in., outside dimensions 34½x45½ in.

No. 37 Units—Have drawers with inside dimensions 25x37½ in., outside dimensions 27¼x40½ in. Special sizes to order.

Bases—Bases for the above units are supplied in four different styles flush to the floor; or on legs, sanitary style.

Oak Blue Print Cabinet Units
Combination 29

Blue Print Sectional Cabinets in Steel

Built on the unit plan—add as requirements demand.

Substantially constructed of cold rolled furniture steel with joints electrically welded. Finished in olive green enamel, baked on. A beautiful and lasting finish that will harmonize with any surroundings.

Each drawer fitted with label holder, substantial pulls, patented paper weights, and hood at back of drawer.

Sizes—Carried in stock in two sizes. Units numbered from 1825 to 1839 have drawers with inside dimensions 25x37 in., outside dimensions of cabinet 28½x40½ in. Units numbered from 1843 to 1857 are 6 in. wider and 7 in. deeper.

Vertical Plan Files Nos. 400 to 405

Plans are held by numerous compression springs, causing evenly distributed pressure against the plans instead of being held at the top only.

Plans are placed in indexed folders, positively held flat and smooth vertically, without fastening at top. No crumpling or breaking down of sheets so filed is possible in this plan file.

Folders are double folded at top edges for extra strength and scored for expansion. This gives stiffness at top edges, prevents tearing and makes it easier to handle folders. Cabinet made of oak, well finished.

Vertical Plan File

Drawing Tables

Perfection-Monroe Adjustable Drawing Tables

Adjustable in height from 31 to 41 in. Top tilting to any angle. White pine tops 23x31 to 36x60 in. with end cleats which allow for expansion and contraction of top.

A very practical, rigid drawing table at a moderate price. The diagonal braces insure rigidity.

Perfection-Monroe Adjustable Drawing Table

Tables Nos. 220 to 247—These tables are made in two different sizes, 36x72 and 42x84 in. The tops are made of selected white pine with end cleats screwed to board with oblong washers and heavy screws which allow for expansion and contraction of board. These tables will take any of our regular No. 32 or No. 37 units for filing purposes.

Drawing Table No. 234

Hamilton Steel Base Adjustable Drawing Tables

A new and unique drawing table. Base of steel—absolutely no breakage in shipment or while in use. Top of best white pine in sizes 36x48, 36x60, and 42x72 in. Adjusting device wonderfully simple, efficient, and positive.

Top cannot possibly drop down accidentally. Top tilts to any angle and vertically.

Finished in olive green baked enamel, attractively striped.

Hamilton Steel Base Adjustable Drawing Table

Drawing Boards

We manufacture six different styles of drawing boards. Made in pine and basswood in any size.

Style D—1½-in. board with 3x1¼-in. maple cleats and oblong washers staggered.

Style D, Drawing Board

Facilities and Experience

This company has had over 45 years' experience in making business furniture. It has a warehouse at Rahway, N. J. so as to insure prompt delivery in the East, as well as in the West.

DRAFTING ROOM FURNITURE and SUPPLIES of all kinds; DRAWING INSTRUMENTS and DRAWING MATERIALS of every sort; all leading brands of TRACING PAPERS and TRACING CLOTHS. SURVEYING INSTRUMENTS and FIELD SUPPLIES.

Pease Peerless Continuous Blue Printing Equipment

Saves Labor—

One boy and a Pease Peerless automatic continuous blue printing equipment can print, wash, potash and dry more and better blue prints in one hour than can be done in four hours with any other equipment using independent methods of washing and drying.

Prints, Washes, Potashes and Dries—

The Pease Peerless equipment will print, wash, potash and dry perfect blue prints in any quantity up to 120 linear yds. per hour at a lower cost per square foot than is possible by any other method. Each operation is automatic and continuous.

Pease Automatic Continuous Blue Printing Machine

Economical on Short Runs—

As short a run as from 5 to 10 yds. can be handled to distinct advantage on Peerless machines and these runs can be made by an operator who has other duties to perform.

Where Used—

Over 2000 Pease Peerless continuous blue printing equipments are in use in the

drafting rooms of architects, engineers, railroads, shipyards, commercial blue printers, industrial plants and Government offices.

Independent Units—

The Pease Peerless blue printing machine can be purchased as an independent unit if desired, and the washing and drying machine later, although the greatest economy is effected by installing the complete equipment.

Catalogue MP-37—

This economical time and labor saving blue printing equipment is completely illustrated and described in Catalogue MP-37. Ask for your copy—it is free.

Pease Vertical Blue Printing Machine and Sheet Washer

For All Cut Sheet Requirements—

Where the demand for blue prints and continuous production does not warrant the purchase of a Pease Peerless Equipment, the Pease Vertical Blue Printing Machine and Sheet Washer, in a variety of sizes, answers every blue printing requirement.

Pease Vertical Electrical Blue Printing Machine and Pease Sheet Washer

Fast Printing Speed—

The Pease Vertical Machines are equipped with the famous Pease U-V Arc Lamps—the fastest blue printing lamps ever produced. These lamps print on either 220 or 110 volts, direct or alternating current (any cycle) with slight adjustment.

Made in Five Sizes—

The Pease Vertical Machine is manufactured in five sizes and the Sheet Washer is made in three sizes to accommodate blue prints of varied dimensions. Both Machine and Sheet Washer are sturdily constructed and can be shipped anywhere without breakage, and are so compact in design that they can be installed in a corner of the drafting room.

Catalogue MV-37—

Both the Pease Vertical Machine and Sheet Washer are fully illustrated and described in this special Machinery Catalogue. Ask for your copy—without obligation.

Pease "Junior" Blue Printing Machine

For Moderate Size Blue Prints and Emergency Use—

The Pease "Junior" will make perfectly finished blue prints in any size up to 24x36 in. in from one to 1½ minutes, with one drop of the lamp, whenever desired, regardless of weather conditions. The Pease "Junior" is equipped with the widely known Pease, Type P, Arc Lamp, which operates on either 110 or 220 volts AC or DC, no special electrical connections being required. The floor space occupied measures only 25x26 in.

Pease "Junior" Machine and Sheet Washer

Pease "Junior" Sheet Washer

The Pease "Junior" Sheet Washer has a tray 28 in. wide, will accommodate a blue print of any size up to 24x36 in. and requires a floor space of only 24x34 in.

Catalogue MJ-37—

Get full facts on this durably constructed, speedy operating, and moderately priced blue printing equipment. Ask for Catalogue MJ-37—sent immediately on request.

Pease Sheet Dryer

No Waiting for Prints to Dry—

Electrically driven, will dry dripping wet prints without wrinkles at a regular rate of 8 linear ft. per minute. The Pease Sheet Dryer is equipped with a revolving copper cylinder that heats up quicker, retains heat longer and to which prints will not adhere.

Eliminates Creased Prints—

A slanting feeding apron drains water away from the point where cylinder and belt meet, thus eliminating steam pockets and resultant creasing of prints.

Pease Automatic Band Control—

All Pease Sheet Dryers are now regularly equipped with the new Pease Automatic Band Control which constantly reg-

Pease Sheet Dryer

ulates all side traveling of the band, thus reducing wear and tear and entirely eliminating the need of adjustment.

A Size for Every Need—

Pease Sheet Dryers are made in three sizes, 57 in. wide, 45 in. wide and 22 in. wide. They are equipped with either electric or gas heated elements. Gas dryers have thermostatic control. When desired, by means of a simple gear shift the dryer may be operated at 4 ft. per minute, or, with a special gear (not regularly furnished), at 2½ ft. per minute. Rear Return Attachment can be provided if desired.

Sheet Dryer Pamphlet SD-37—

Ask for this pamphlet, completely illustrating and describing all types of Pease Sheet Dryers.

Pease Blue Print Paper

Nearest Non-fading Blue Print Paper in Existence—

Pease Blue Print Paper is especially coated on machines of our own design with a scientifically prepared formula, under an improved process. Pease papers and cloths have an exceptionally good color—are coated in four printing speeds and have lasting qualities which make them excellent papers for permanent prints.

Guaranteed Rag Stock—

Every roll of Pease Blue Print Paper is guaranteed to be exactly the rag content stock specified by the customer, of full measure, and in one piece.

Pease Universal Reproduction Cloth

The cost of making prints on Pease Reproduction Cloth is very low and these reproductions can be obtained on either the Pease "Peerless" or Pease "Vertical" machine. There is no celluloid surfacing used, tracings will not crack or chip off, and dampness will not injure the cloth. In fact, it will stand up under hard usage which would practically ruin most other reproduction cloth.

Pease Drawing and Tracing Papers and Cloths

Uniformity of both surface and thickness of Pease papers and cloths is a certainty, as they are manufactured in specially equipped mills, using only high grade raw materials.

Sample books or working samples will be furnished immediately upon request, or specimens with quotations on printed sheets of either paper or cloth will be furnished if desired. Ask for sample book DTP-37.

Pease Drafting Room Furniture

No. 2253
Pease Drawing Table

Drawing Tables—

Pease Drawing Tables are sturdily constructed of the very best materials, eliminate wobbling to the greatest possible extent, and are attractively finished, combining utility and durability with appearance.

Steel and Wooden Stools—
Pease Adjustable Drafts-

Cabinet No. 2266

men's Stools are made with or without foot rest and back rest. Special construction eliminates stress and strain to a marked degree. One of the latest designed stools has a four-point suspension spring seat which is particularly comfortable and relieves fatigue.

Steel and Wooden Filing Cabinets—

Pease Steel Filing Cabinets protect valuable drawings and tracings from fire and damage and eliminate wear and tear. Joints are securely put together—there is no sagging. Finished in olive green baked enamel, they present an excellent appearance.

Pease Wooden Filing Cabinets are made of well-seasoned and thoroughly kiln-dried oak. The drawers are constructed with dovetailed joints and sliding grooves, there being no rails

between. Pease Wooden Cabinets are specially finished in a golden oak covered by three coats of varnish.

All Pease cabinets are designed on the sectional plan—all units are uniform in size and finish so that whenever purchased, all sections will fit in perfectly.

Furniture Catalogue F-37—

Send for your copy of this catalogue covering the complete line of Pease Drafting Room Furniture.

Pease Parallel Rule Attachment

Can be used with any drawing table. Always handy—never in the way—eliminates lost motion—can be readily installed on any style of drawing board. Consists of very few parts.

Simple construction means simple operation and the complete mechanism is entirely beneath the table top. The two special clamps, designed for holding any standard straight-edge, slide smoothly and evenly on a double chain drive with connecting rod. Two screw tension regulators are provided for taking up slack in the chain.

Ask for prices on attachments—with separate prices on straightedges. State length and width of drawing board.

Note Simple Construction, Meaning Simple Operation

No Strings or Cords to Stretch or Break

Pease Parallel Rule Attachment

Pease Imported Drawing Instruments

Pease Imported Drawing Instruments contain that proper balance and degree of precision found only in high grade instruments. Simple mechanical construction and a smooth, nickel finish insures freedom from lost movement, makes Pease instruments easy to manipulate, and insures accurate drawings and tracings.

Complete sets manufactured in two styles—semi-flat and square but various assortments or separate pieces may be obtained if desired.

Ask for Catalogue DI-37; contains complete data and list of latest prices.

Pease Imported Drawing Instruments

Scales, Angles and T-Squares

Includes a complete line of plain, boxwood and celluloid scales, angles, T-squares, slide rules, curves, straightedges, and every requirement, in all sizes, for drafting room or field work.

Pease Scale No. 1233

Surveying and Engineering Instruments

These include several types of levels and transits, a complete line of leveling rods, measuring tapes and field books, as well as other accessories.

Catalogue G-37

This is our General Catalogue covering the complete line of Pease Blue Printing Machinery, Blue Print Paper, Drafting Room Furniture, Drawing Materials, and Surveyors' and Engineers' Supplies. In fact, Catalogue G-37 actually covers "Everything for blue-printing—everything for the drafting room!" Ask for your copy.

Products**WICKES CONTINUOUS ELECTRIC BLUE PRINTING MACHINES.**

Also builders of Standard Heavy Duty Engine Lathes, Crankshaft Lathes, Production Lathes, Heavy Duty Punches (vertical and horizontal), Shears (plate, bar, structural), Bending Rolls (horizontal, vertical, and angle), Radial Wall Drills, Flanging Clamps.

Wickes Blue Printing Machines

Operation—The Wickes continuous electric blue printing machine will print separately cut sheets or continuous rolls in any length and in widths varying from 2 to 48 in. The paper and tracing, placed on a continuous traveling belt, are carried to the feed roller and around the printing cylinder in which is mounted the lighting element. The printed paper is then delivered to a light-tight storage compartment.

ment and the tracing is returned to the operator or carried to the storage compartment, as desired.

The machine is entirely automatic, the only work required of the operator being the placing of the tracing and blue print paper on the traveling belt. The entire operating mechanism is controlled by three toggle switches conveniently located for the operator, one being for the motor and one for each auxiliary, thus controlling each light on a separate starting apparatus. The operator, without changing position, can start, stop, reverse or vary speed of drive. All wiring is in metallic conduit, the entire electrical mechanism being approved by the National Board of Fire Underwriters.

Lighting Elements—The light is obtained from two mercury vapor lamps of standard pattern. These lamps operate at a very low temperature and require absolutely no attention from the operator at any time.

Printing Cylinder—The printing cylinder which surrounds the lighting element is composed of longitudinal and spirally disposed wires, woven right-handed on one side of the center of the machine and left-handed on the other side. The cylinder is stationary and the tracing and blue print paper are carried around it by the traveling belt. The light is projected directly in a radial line through the tracing without having to pass

through any intervening glass, the spirally disposed wires offering much less actual obstruction to the light than any glass cylinder would. The right and left-handed spirally woven wires impart a very desirable ironing and spreading effect to the entire surface of the tracing. The tracing and paper pass over 92% of the circumference of the cylinder.

Continuous Traveling Belt—The contact between the tracing and the paper is secured by means of a single, wide, continuous belt which passes around the feed rolls and the metallic printing cylinder. The tension of this belt is regulated automatically. Its life is guaranteed for three years' service.

Advantages of the Wickes Blue Printing Machine—Blue prints are made with an absolutely uniform tone throughout.

The operator is not required to work in a darkened room, the light-tight compartments making this unnecessary.

The operation of the machine is so simple that any person, however inexperienced, can make perfect prints with it.

There is no glass cylinder to clean, break or replace, our metallic cylinder being self-cleaning and unbreakable.

The power required is exceptionally low; the consumption when running at maximum capacity being but .015 kw. per sq. yd.

Wickes Continuous Electric Blue Printing Machine

Model 20 Blue Printing Machine

The Model 20 machine carrying two lighting elements on separate starting apparatus has a capacity of 400 sq. yd. per 8-hour day. With the improved variable speed, 4-step, quick change gear box and adjustment of motor on iron driving disc, the printing speed can be adjusted to suit any grade of paper, including Van Dyck's. The machine is entirely self-contained; is 30 in. high and requires a floor space of 2 ft. 6 in. x 5 ft.

Model 15 Blue Printing Machine

The Model 15 machine is constructed exactly like the Model 20 except that it carries only one lighting element, decreasing the printing speed about one-half. It is so constructed that another lighting element can be added at any time as required, thus changing it to a Model 20 machine.

Catalogues

Catalogues fully describing the Wickes blue printing machines will be sent on request.

General Engineering Service

CONSULTATION SERVICES in all ENGINEERING FIELDS: MECHANICAL, CIVIL, HYDRAULIC, ELECTRICAL and CHEMICAL.

The SUPERVISION and DETAIL INSPECTION of CONCRETE CONSTRUCTION, including EXAMINATIONS and REPORTS upon the SUITABILITY of AGGREGATES.

SOIL TESTS, TEST BORINGS and REPORTS upon the SAME in CONNECTION with FOUNDATIONS.

Also, Reports on Permissible Floor Loads and on Existing Conditions of Buildings and other structures.

Pittsburgh, St. Louis, Kansas City, San Francisco, Birmingham, Montreal, Toronto, Vancouver and London.

Soil Tests, Test Borings and Reports

The scientific method of determining areas of foundations, permissible loads per square foot and the probable ultimate settlement under load, based on an analysis of direct soil loading tests and borings, as compared with our records of the results of similar investigations.

Testing, Physical, Chemical and Machinery

Strength tests of materials and systems of construction—steel, iron, cement, brick; columns, beams, floor slabs, partitions and other members.

Chemical tests of all building materials, including steel, iron, cement, paint, oils, slags, limestones, marls and clays.

Duty and efficiency tests of entire plants—engines, boilers, pumps, compressors and other machinery.

Structural Steel Inspection

The inspection of structural material at the mills and foundries, including the identification and witnessing of physical tests.

The supervision and inspection of workmanship, checking the sections, dimensions and detail connections during the course of fabrication at the shops, insuring the proper handling of the material, first class workmanship, accurate construction, thorough painting and distinct marking, thus facilitating the erection at the site.

Estimation of weights from detail drawings, and checking shipped weights of finished work.

The supervision and detail inspection of the structure during erection.

Cement Inspection

The testing of cement, including the sampling in car load or bin lots, at the mills or warehouses or when delivered on the work, and the identifying of each lot with serially numbered blue tags.

Complete cement and chemical laboratories in connection with cement testing at Chicago, New York,

Specification Forms

The following is a form for incorporation in specifications for buildings and other structures, covering the necessary arrangements for inspection and relationship between inspector and contractor:

Materials of Construction—Shall be inspected and tested by ROBERT W. HUNT COMPANY, who will act under instructions of the architect or engineer, and report to him the results of inspection and progress of the work, and otherwise facilitate prompt and early delivery of satisfactory materials. The inspectors shall also place marks of identification on accepted materials. Such inspection shall not relieve contractor from responsibility to furnish satisfactory material, but is a measure of precaution against oversights and errors. The cost of this inspection is to be borne by the contractor unless otherwise stipulated.

Structural Steel—Shall be inspected and tested at the rolling mills and also inspected at the shops during fabrication, in proper manner, to determine whether the material conforms with the plans and specifications. Contractor shall furnish inspector necessary facilities for inspecting, testing and labor for handling material.

Reinforcing Steel—Shall be inspected and tested at the mill or warehouse in proper manner, contractor furnishing, free of charge, testing apparatus and facilities for inspection.

Cement—Shall be sampled and tested before delivery to the work, in accordance with American Society for Testing Materials, or the special specifications attached.

Standard Specifications

Services

THE FOUNDATION COMPANY is an organization of Construction Engineers widely experienced in BUILDING DIFFICULT SUPERSTRUCTURES and SUBSTRUCTURES in all parts of the world. The enviable reputation gained in its early history for trustworthy underground construction has followed it into the field of GENERAL CONTRACTING.

THE FOUNDATION COMPANY has built buildings of nearly every known type such as offices, banks, stores, hotels, club houses, dwellings, and also the whole range

of industrial buildings, power plants, etc. This company is successfully building warehouses, railroad terminals, filtration and sewage plants, hydro-electric developments, highways, bridges and bridge piers, mine shafts and tunnels, river and harbor developments and complete industrial projects.

As its name would indicate, THE FOUNDATION COMPANY also specializes in underpinning and foundations. Most of the skyscrapers in lower New York City rest on foundations built by this Company.

The Foundation Company, General Contractor

JOSLIN MOTOR RAMP CO.

L. S. JOSLIN, CONSULTING GARAGE ARCHITECT

339 Newbury Street

BOSTON, MASS.

Product

SIMPLE, SIMPLEX, and DUPLEX MOTOR RAMPS for large garages maintaining level floors. All rights are fully protected by patents pending.

Service to Architects

Architects are invited to submit to us plot plans of large proposed garages, and without expense to them we will show them how our ramps will work out. If any of our systems are used, we will give them advice in all matters pertaining to a modern garage without any charge.

Level Floors

Level floors mean a better building, cheaper construction, lower operating cost and a building that can be converted to other purposes at a minimum of expense.

Ramps

All modern garages are embodying some system of ramps for interfloor travel. For the best results ramps should not exceed twelve per cent grade and should be laid out so as to make travel both up and down as safe as possible. Joslin Ramps do all this and while they are not the answer for all plots of land, they are the answer for the larger garages as a careful study will show.

Straight ramps, like the Simplex and Duplex extending from floor to floor, necessitate only one-half as much turning as ramps with staggered floors. They are not tunnels, but clear open driveways giving clear vision at all times.

Space Required

Straight ramps of the same incline and width, however arranged, will require the same amount of floor space.

Circular ramps require more room. Duplex ramps naturally require more floor space than single ramps as they do twice the work.

Street Facilities

Do not put a garage of greater capacity than the capacity of the streets on which it faces, and if it only has one entrance and exit avoid a one-way street, if possible.

Garages of capacity of over 1000 cars should have facilities for cars to enter and leave on two or more streets, with proper ramps to handle traffic both in and out on these streets.

Cost to Owner

For the use of Joslin Motor Ramps and our advisory service, a charge is made depending on the type of ramp and size of the garage.

Installations

The New Y-D Service Garage at Worcester, Mass., has the Joslin Simplex Ramp. This garage has a present capacity of 400 cars and provision is made for two additional stories and roof parking.

The New Motor Mart at Park Square, Boston, Mass., the largest and finest garage in the world, covering an area of 52,000 sq. ft., eight stories high with stores on the first floor, a capacity of 2000 cars and provision for two additional stories, is equipped with the Joslin Duplex Ramp.

A large number of others are pending at this writing.

Simple Ramp

The Simple Ramp provides independent roadways for both lines of autos; cars traveling on the floor from the end of one ramp to the end of the next ramp are always traveling in the same direction—never toward each other. This ramp is particularly suitable for boarding and truck garages with a capacity up to 500 cars.

Simplex Ramp

The Simplex Ramp varies from the Simple Ramp in that the up and down ramps are not side by side but are separated any distance required. In this arrangement cars do not have to travel as far on each floor before ascending or descending, and the up and down cars do not even see each other. Another advantage is that both ramps can be used at one time for all cars either in or out without the slightest chance of interference. This arrangement will take care of twice as many cars during the rush hours when required. This is suitable for garages up to 1000 cars capacity.

Duplex Ramp

The Duplex Ramp allows two lines of cars to ascend and two lines of cars to descend at the same time without any confusion. The two lines of ascending cars never see each other. The same is true of the two lines of descending cars. One line of each incoming and outgoing cars to one street and the other line to another street. Both incoming and outgoing cars are always traveling in the same direction. A person driving down the ramps can choose the street he wishes to go out on. If headed down so as to come out on one street, by simply driving around to the opposite side of the ramp and taking the down ramp he will come out on the other street. One or both series of ramps can be carried as many stories underground as required. For one basement one pair of ramps is sufficient. For two or three subbasements it would be advisable to use both pairs of ramps.

This system is designed for larger garages facing on two or more streets and having a capacity up to 4000 cars.

RAMP BUILDINGS CORPORATION

Consulting Garage Engineers

21 East 40th Street
NEW YORK, N. Y.

Product

D'HUMY MOTORAMPS, a patented System of Garage Design, involving a combination of ramps with staggered floor levels, the building being divided into two or more units.

Building Design as It Affects the Commercial Success of a Multi-floor Garage

(1) Because garage revenue is directly proportioned to the number of cars stored, maximum car capacity for any given floor area is an absolute essential.

building will not show the staggered effect in its fenestration on either of two facades.

d'Humy Motoramps are adaptable for plots of any dimension greater than 50-ft. frontage and can be readily adapted to plots of irregular contour. The ramp location is as flexible as that of elevators. d'Humy Motoramps have been used in 2-story buildings and in garages as high as 10 stories—and higher buildings are contemplated.

Single roadway d'Humy Motoramps (with passing points at every floor-level aisle) are ordinarily

Cut-away Perspective Drawing of a Typical d'Humy Motoramp Garage
(Single Ramp System—up and down traffic on same ramps)

(2) Operating economy demands a building in which each car pays for its own vertical transportation—via ramps.

(3) The building must be designed to give the patron a measure of convenience, safety and service which will attract and hold business.

d'Humy Motoramps

This patented system of building design is based on the staggering of floor levels in at least two portions of a building and connecting each half-story difference in floor level with short ramp inclines.

The division line between two of the units of the structure may extend across one dimension of the building or may be arranged in a rear corner so that the

used in garages up to 4 or 6 stories high where the storage floors house 50 to 60 cars each. Generally for larger garages, or where the peak traffic load makes greater ramp capacity desirable, double roadway motoramps are advisable. The latter arrangement provides separate paths for up and for down traffic. The type of Motoramp and the ramp arrangement should in all cases be chosen in consideration of the particular conditions which obtain. This company will be glad to discuss such matters, entirely without obligation.

Advantages of d'Humy Motoramps

Storage efficiency in any building at least equal to elevators and 10 to 25% better than ordinary ramp floor layouts. Maximum possible income.

A Typical Interior Showing the Short Ramp Length, Easy Grade and Complete Visibility

Traffic capacity beyond any elevator equipment, and in excess of oldstyle floor-to-floor ramps because of better visibility and minimum possible interference in short travel through storage aisles.

Simple construction, easy formwork and no structural complications.

Building convertible into two standard type structures.

Safety for patrons. Open side ramps afford complete visibility for the turn ahead.

Specifications

The term d'Humy Motoramp in these specifications shall be understood to describe the short ramp between floor levels in one portion of the building which are mid-way between the floor levels in another part—a special and patented type of building design known as the d'Humy Motoramp System and licensed for use in this structure by RAMP BUILDINGS CORPORATION, New York, N. Y.

Essential Design Data

Car Spaces—6 ft. 8 in. to 7 ft. in width, 12 to 15 ft. in depth.

Aisles—20-ft. width in the clear.

Car Bays—Three car bays are usually most efficient.

Columns—Outside face of column set back 1 ft. from line of car spaces.

Ramp Grade—From 13% to 15%.

Story Heights—10 ft. 6 in. to 11 ft., floor to floor.

A minimum clear headroom of 8 ft. 6 in. should be maintained.

Note: For complete data ask us for Garage Design Data Sheets. The above data is necessarily approximate. Exact dimensions must be determined by local conditions and requirements. The specialized experience of this company's engineers is available to architects, as noted in a following paragraph. Consult us before your plans are laid out; we can save your time.

Ramp Buildings Corporation Services

Working with and through the architect in all matters, the company places its specialized knowledge at his disposal in furthering any project in which d'Humy Motoramps can be used.

Where desired, sketch plans (in miniature) will be prepared, without obligation, to demonstrate the relative superiority in storage efficiency of the d'Humy Motoramp design.

Complete consulting advice is available, without cost to the architect, on the establishment of critical dimensions, planning of entrance, service and control facilities, etc., upon the arrangement of a contract between the owner and RAMP BUILDINGS CORPORATION for the use of the d'Humy Motoramp System.

License Fees for Use of d'Humy Motoramp Design

The company licenses the use of its design patents after a standard scale of fees proportionate to the total floor area devoted to garage purposes. This fee is a charge made to the owner and is payable, if when and as the building is erected.

References

d'Humy Motoramps have been specified as a profitable investment in the building of well over 150 recent garages in 76 cities in three countries. Among these are:

GAS SERVICE AND EQUIPMENT

Recommended by Architects' and Builders' Service Committee

AMERICAN GAS ASSOCIATION

420 Lexington Avenue

NEW YORK, N. Y.

Gas in the Service of the Home

Due to recent development in the manufacture of gas appliances, gas has entered into a new era of usefulness in the home. Gas is now the most modern agent for cooking and refrigerating food, incineration of household waste, providing hot water for household cleanliness and for personal toilet, insuring comfortable house temperature at all seasons of the year, and for permitting clothes to be washed, dried and ironed in the home under conditions of known cleanliness. These services make gas the world's greatest caterer to the fundamental needs of the home.

are urged to specify and install only appliances which have been tested and approved by the American Gas Association Appliance Testing Laboratory. A list of the trade names and model numbers, as well as the names of the manufacturers of approved appliances may be secured gratis from your local gas company or from the AMERICAN GAS ASSOCIATION, 420 Lexington Avenue, New York, N. Y.

Original Installation

The increasing uses of gas make it more necessary than ever for the builder to provide the comforts and conveniences of modern gas service for the home owner at the lowest cost, by installing the proper piping and flues at the time the house is erected, which will permit the use of the various appliances thereafter.

Cost of Piping

The cost of gas piping and flues, *if put in at the time of erection*, is relatively small when compared to the total cost of the building and compared to the increased rental value of the premises so equipped. This cost varies from 0.10 to 1.0% of the total cost of the building, the latter figure covering the most elaborate piping layout required to cover every possible contingency.

Selection of Appliances

No gas appliances should be installed which are not susceptible of such adjustment as will enable the user to bring about the complete combustion of the gas supplied under all reasonable service conditions. Because it is somewhat difficult for those not experienced in the utilization of gas to judge whether or not a given appliance is designed to comply with this requirement the AMERICAN GAS ASSOCIATION established an elaborate Testing Laboratory, which tests all types of gas appliances, not only for safety, but also for efficiency and durability, and identifies all appliances meeting these requirements by the official Blue Star Laboratory Seal.

A.G.A. Appliance Testing Laboratory

The laboratory has been established for the protection of gas users, and the seal is not a manufacturer's trademark, but a symbol of quality applied to all appliances that meet the testing requirements. These requirements represent the best thought of the gas industry and of the several interested governmental bureaus on this subject. Architects and builders

Kitchen Range

The range is the most important piece of kitchen equipment. It is the most used housekeeping device. The modern gas range with oven heat control has changed cooking from drudgery to a real pleasure. No modern home is complete without one of these new heat controlled ranges, which eliminate guesswork in cooking and permit the housewife to go about her other duties, secure in the knowledge that the food will be cooked to a turn.

The Modern All-enamel Kitchen Range

Suitable for usual household requirements. The oven is 18 in. wide and is equipped with thermostatic regulator which simplifies cooking

The following are the essential qualities of a range which will give real satisfaction to the home owner:

- (1) *Convenience*: as to size, arrangement of parts, ease of control, and simplicity in cleaning.
- (2) *Efficiency*: in the use of fuel without waste.
- (3) *Safety*: correct construction to avoid hazards, such as incomplete combustion.
- (4) *Attractiveness*: an important point in the opinion of the user.
- (5) The Blue Star Laboratory Seal of the AMERICAN GAS ASSOCIATION, which is a guarantee of satisfaction.

Hot Water Service

A plentiful and ever-ready supply of hot water is a most vital and sanitary need of any household and is essential to the comfort and cleanliness of the home and the family. Gas-fired water heaters of high efficiency and reliability are available in two main types.

Automatic Storage Type Water Heater

In this type of heater the water is always kept hot ready for use. Equipped with down-draft diverter and installed with a flue connection

One of these is the automatic instantaneous water heater which is suitable for water supply under a pressure of 10 lbs. or more at the highest faucet. On this type of heater the gas burners operate only while the water flows from the faucet (the burner being ignited by a pilot light and controlled by a valve operated by the water pressure). These heaters are both economical and efficient, but because of their large temporary demand of gas, require a larger supply of pipe and meter.

The other type of water heater is the automatic storage heater which consists of an insulated water tank, a pilot light, thermostat and gas burner, so connected that the tank is always kept full of hot water ready for use. This type can be used on low pressure water supply and requires only a $\frac{3}{4}$ -in. gas pipe and meter of corresponding size.

Where an installation is required at minimum cost, a non-automatic hot water service can be secured through the use of the circulating or tank type of gas water heater, manually controlled. Accessories can be had for this type of heater, whereby the gas can be automatically turned off after a given time. It is also possible to convert this type of heater to the automatic type later if desired.

Location of Water Heater—Water heaters should not be installed in bathrooms or other closely confined spaces, and the length of the hot water lines should not be excessive.

All automatic water heaters should be provided with flue connections.

Auxiliary Room Heating

Individual gas room heaters provide a welcome service during many days of Fall and Spring in removing chill and dampness from the room without necessitating the operation of the main furnace, which is not designed for efficiency when operated at low temperature and for short periods.

Room heaters are available in several types as follows:

- (1) The radiant heater, often called a fireplace heater.
- (2) Individual gas-fired radiators, steam or hot air type.
- (3) Portable heaters, not radiant type but flame type.
- (4) Wall heaters, flame type.

For general attractiveness the radiant heater is a superior form of room heating equipment, particularly when installed as fireplace unit.

Gas-fired steam radiators may be tied into the regular heating system, either steam or hot water, and operated either as individual heating units, or utilized to supplement the regular heating system during severe weather.

Portable heaters are available in many styles and sizes, including even a small radiant type. They are lower in cost than other auxiliary heaters and are frequently connected by means of flexible tubing, although this is not a recommended practice.

Where flexible hose connections are necessary, a safe installation can be made by providing the gas outlet nipple, heater inlet nipple and the flexible tubing utilized is of the type that has been tested and approved by the AMERICAN GAS ASSOCIATION Testing Laboratory. The shut-off cock for portable heaters should be located in the gas pipe outlet and not on the appliance.

Radiant Fireplace Installation

This type of heater adds beauty and charm to any room. It is more efficient, cleaner and safer than a wood fire, and is as attractive

Laundry Equipment

Weather statistics show that less than one-half of the days of the year are suitable for drying clothes outdoors. The modern housewife appreciates nothing more than a laundry dryer, which permits her to dry

Ironer, Dryer and Washer Installation

With these gas-fired appliances, washday ceases to be a burden and ignores weather conditions

the laundry quicker and better in her own basement, independent of the vagaries of the weather. Gas-fired dryers produce the same freshness, whiteness and freedom from mildew as outdoor drying and eliminate the labor of carrying the laundry in and out of the house.

Several makes of electric washing machines are equipped with gas burners to raise the temperature of the wash water economically and quickly. Where the washing machine is not so equipped, it is advisable to install a laundry stove for boiling the wash or reheating water for the washing machine.

Ironing machines, utilizing gas for heating the rolls, operate more economically than those employing other heating methods. The home laundry provided with complete gas-fired laundry equipment carries the assurance that clothes, linens, blankets, and all household laundry can be washed, dried and ironed under sanitary home conditions with less effort than ever before possible.

Heating the Whole House by Gas

The house equipped with a gas-fired furnace gives positive assurance the home will always be kept warm and comfortable at a uniform temperature automatically, without any of the customary labor and attention. Gas furnaces are manufactured to meet all heating requirements—that is, for steam heat, vapor heat, hot water heat, or warm air systems. Each of these types has its special advantages and, as with solid fuels, the hot water heating system is slightly more efficient, sometimes running as high as 90%.

Amount of Gas Required for House Heating—The uniformity of the heating value of gas as a fuel makes it possible to predict with great accuracy the amount required to heat a home of any given size; once the climatic conditions in the particular section of the country are taken into account,

The local gas company has a complete file of this information, and with data on the size of the house, construction of the walls and roof can easily provide an accurate estimate of the cost of house heating by gas.

A recent development, which has taken place simultaneously with the use of gas for house heating, is to insulate the homes to reduce the loss of heat. The wall and roof heat losses can be cut to one-third of their normal value by the use of insulation with corresponding reduction in the amount of radiation and furnace size, as well as the operating expenses of heating the house. Oftentimes the savings in installation and cost of operation cover the added cost of insulating the house and make it possible to utilize gas for heating the home at little or no extra cost over solid fuel.

All gas-fired heating systems should be thermostatically controlled, inasmuch as the saving in fuel under these conditions and the uniform temperature made possible, more than pay for the added cost of the heat controlled equipment.

The development of automatic heating with gas as a fuel, for the first time recovers the space ordinarily required for coal bins and ash bins, and makes it available as a clean and useful part of the house.

Incineration

The gas-fired incinerator makes possible the complete disposal of household garbage, safeguards health, and saves labor and eliminates the unpleasant odors and opportunity for the spread of disease resulting from accumulation of garbage between collections by the municipality. In addition to this, the use of the incinerator avoids the fire hazard caused by the accumulation of old boxes, paper, etc., about the house.

The installation of an incinerator requires a flue, and therefore this appliance should be located as near to the chimney as possible. Oftentimes it is possible to install a chute from the kitchen, which will save all the labor of carrying the refuse downstairs to the incinerator.

A Notable Installation in a Six-room Insulated House

The heating system is hot water, using the small boiler at the left (which type is also used for water heating in other instances). Here the hot water supply is taken from the automatic storage heater (center); and the incinerator (right) disposes of all garbage and waste. This basement is used as a playroom, workshop and living room

Installation of Appliances

No less important than the quality of the appliance itself is the provision of adequate supply piping, in order to insure the safe and satisfactory performance of gas appliances. Piping of the proper size insures constant and sufficient gas pressure and results in uniform operation of the burners, giving complete combustion and insuring reliable performance.

The following table gives the gas consumption of various domestic appliances and indicates the size of outlet ordinarily necessary for each appliance:

Appliances	Size of outlet ordinarily necessary, in.	Usual maximum gas consumption per hour, cu. ft.*
For the Kitchen:		
Gas range.....	$\frac{3}{4}$	110
Gas refrigerator.....	$\frac{3}{4}$	2 for continuous type 30 for intermittent type
For the Basement:		
Gas water heaters:		
Manual	$\frac{3}{4}$	40 to 80
Instantaneous	$1\frac{1}{4}$ to $1\frac{1}{2}$	60 per gallon rating
Automatic storage.....	$\frac{3}{4}$ to 1	60 to 80
Gas incinerator.....	$\frac{3}{4}$	40 to 60
Gas boilers.....	$1\frac{1}{2}$ to $2\frac{1}{2}$	300 to 1600
		About 85 per hour per 100 sq. ft. installed cast iron steam radiation
Gas warm air furnaces..	$1\frac{1}{2}$ to $2\frac{1}{2}$	250 to 1000
		About 35 per hour per 10,000 B.t.u. hourly heat loss from the building
For the Laundry:		
Gas heated laundry dryer	$\frac{3}{4}$	20
Gas laundry stove....	$\frac{3}{4}$	30
Gas ironing machines.	$\frac{3}{4}$	20
Gas washing machines	$\frac{3}{4}$	20
For Space Heating:		
Gas radiant heaters (for fireplaces).....	$\frac{3}{4}$	30 (or 3 per radiant)
Gas room heaters (flame type).....	$\frac{3}{4}$	15 to 30
Gas radiators (warm air)	$\frac{3}{4}$	15 to 30
Gas radiators (steam)	$\frac{3}{4}$	3 per section
Gas floor furnaces....	$\frac{3}{4}$ to 1	100
Gas garage heaters....	1	50
Gas ignitors for fire- places	$\frac{3}{4}$	5
Gas wall heaters.....	$\frac{3}{4}$	15

*Note: For natural gas installation these figures should be divided by two.

General Principles of Installation

As local conditions govern to a great extent the practice and installation of gas piping it is urged that before the contract is let for this important part of your building, your local gas company be consulted. The following general conditions, however, apply in practically every community throughout the country.

Appliances shall be installed so that their continued operation will not in any way create a fire hazard because of adjacent flammable material. Vent pipes should not be run closer than 6 in. to unprotected ceilings and wooden joists.

Any appliance which consumes large quantities of gas, upon which is automatically controlled and which

depends upon a pilot light for ignition, shall be connected to an adequate flue or flue pipe.

This rule is particularly significant with regard to the very large appliances such as central heating systems. These burn such large quantities of gas that every precaution should be taken. As further protection, it is advisable to insist on thermostatic or other forms of safety pilot which shall cut off the main gas supply in event that the pilot is extinguished.

No water heating appliance shall be installed in a closed system of water piping unless a water relief valve is provided.

The presence of a water meter will serve to make it a closed system, as water meters permit the flow in only one direction. It is to be recommended, then, that all water heating systems be operated with a pressure relief valve at some point.

Proper Piping for Domestic Gas Service

Four factors determine the size of pipe needed; length of pipe, maximum gas consumption to be provided for, the allowable loss in pressure from the meter to the appliance and the specific gravity of the gas.

Your gas company will be glad to furnish the proper pipe sizes to insure good service to your installation of gas appliances, upon request and without charge.

Miscellaneous Recommendations

Piping should not be laid under tile, parquet or mosaic floors, where it is possible to avoid it. Piping should not be run along the bottom of beams that are to be covered with lath and plaster, but should be run along the top of beams or joists, where it is possible, so that it will be accessible by raising the floor boards, which, when covering such piping, should be fastened with brass screws.

All parts of piping should be securely and permanently fastened to or supported from the building itself. If this is not done, sags or undue strains may later develop and the piping may leak or condensation may accumulate in the low points of the sags and interfere with the free flow of gas.

All piping should be graded toward the meter or outlet—condensation can then be removed if necessary. Meters should be set in a clean, dry, safe place, not subject to wide variations in temperature.

Your gas company has complete information on the size, price and instruction for installing all of the equipment mentioned herein, and will be glad to supply this information upon request without obligation or cost to you.

In addition, the Architects' and Builders' Service Committee of the AMERICAN GAS ASSOCIATION will be glad to furnish specific answers to any questions relating to the design, construction and installation of gas service in the home. This data will be furnished without charge.

Of necessity, the appliances shown here are of particular makes. However, the showing of a particular manufacturer's product here expresses no preference of the A.G.A. for that particular brand.

AMERICAN TELEPHONE AND TELEGRAPH COMPANY

AND ASSOCIATED COMPANIES

An Invitation to Architects to Avail Themselves of Telephone Engineering Experience

In modern office buildings, hotels and apartment houses, large numbers of telephones are required. Unless suitable facilities are provided during construction for accommodating the cables and wires and for running them through walls and floors, costly alterations may be required after the completion of the building.

It is, therefore, desirable that the probable needs of such buildings with respect to telephone service, be forecast as accurately as possible. It is also of great importance to owners and architects in preparing plans and specifications for buildings requiring extensive telephone service, that suitable arrangements be made for such telephone wiring and terminal boxes as the character and use of the building will demand.

While the general manner of wiring buildings of the same class will be similar, the particular requirements may differ considerably on account of special conditions. Every large building, to a certain extent, presents problems of its own for which advantageous and economic arrangements can frequently be suggested by those who are especially familiar with work of this kind. The engineers of the Bell System are always glad to place their experience in these matters at the disposal of architects, owners and builders, and to assist in planning the best system for each particular case. It is, therefore, suggested that architects, before completing building plans, communicate with the engineers of the Associated Bell Telephone Company operating in the locality of the building project.

BOSTON ACOUSTICAL ENGINEERING COMPANY

46 Cornhill

BOSTON, MASS.

Products

MATERIALS for ACOUSTIC CORRECTION and SOUND INSULATION.

ACOUSTEX—a sound absorbing slab for acoustic correction.

For Silen-Stone—a decorative artificial stone tile or slab with a high coefficient of sound absorption—see page A323; for Trimount Sound Proof Doors and Folding Partitions, see page B1131.

Acoustical Treatments for Modern Buildings

The diminution of noise is taking an increasingly prominent place in the design of modern buildings. Banks, offices, schools, churches, hospitals, courtrooms, etc., are all benefited by quiet conditions.

The large areas of hard non-sound absorbing materials used in the construction of present day buildings make it necessary that a highly sound absorbing material be introduced to compensate for the use of hard sound reflecting materials.

Acoustex, the result of many years of research and experimentation, is such a material; besides being a practical, efficient and scientifically correct sound absorbent, it has a beautiful and interesting but unobtrusive texture.

Baeco Products

Properties That Make Acoustex an Ideal Sound Absorbing Material

Acoustex is fire resisting and is not affected by extremes of temperature.

Absorption Value—Tests made by Professor W. R. Barss, Massachusetts Institute of Technology, show that Acoustex 1 in. thick has a coefficient of absorption of .51 (frequency of 512 vibrations per sec.).

Decoration—Acoustex can be sized, and spray painted with a light cream color oil paint, or with any other color desired.

It may be vacuum cleaned and redecorated by spray-painting the surface. This can be done a number of times without causing the pores to fill with paint, or without greatly impairing its acoustic efficiency.

Sizes—Acoustex is furnished in slab or tile form, 12x12, 12x24, 24x60 in. Special sizes cut to order. Standard thickness 1 in.

Joints—Regular type Acoustex is furnished with rough sawn square edges, which, when laid together, produce close fitting joints so desirable for ceiling treatment. It may also be furnished with beveled edges when required.

R. GUASTAVINO COMPANY

INCORPORATED

Timbrel Arch Construction and Masonry Acoustical Installations

BOSTON, MASS.
40 COURT STREET

225 West 34th Street
NEW YORK, N. Y.

FACTORY
WOBURN, MASS.

Products and Services

The business of this company is that of DESIGNING and INSTALLING the SYSTEM of TIMBREL ARCH CONSTRUCTION, and the installation of fireproof acoustic material known as AKOUSTOLITH.

Also Rumford Ceramic Acoustic Tile.

Note: It is important to record that Professor Sabine and Mr. Guastavino were the first in the acoustical field to develop along correct technical lines and to bring to a point of commerciability, a masonry fireproof material having a sound absorbing or acoustical value many times greater than that of ordinary plaster, and, in view of that fact, the United States Patent Office has awarded to these inventors patents which are basic to a sound absorbing material of the character of our Akoustolith and which covers the use of that material in any form it may be prepared or used.

Co-operation

Owing to the varied uses of our construction, involving engineering and architectural features, the more satisfactory method is to send us, before the plans are fully drawn, a sketch outline of the requirements, which will enable us to indicate the most approved method of treatment and the approximate cost.

The service of our acoustical engineer is at the architect's disposal in order to determine the correct location and amounts of AKOUSTOLITH TILE or PLASTER.

Facilities

This company owns and operates for its sole use, as contractors, a factory for the manufacture of the better grades of glazed and unglazed tile and acoustic tile required as a soffit course in vaulted construction. It has, therefore, unexcelled facilities for prompt installation and the making of special pieces in connection with its contracting business.

Akoustolith Tile

Description—AKOUSTOLITH TILE is an all-masonry material having a sound absorbing or acoustical value higher than any other masonry material on the market. Its value has been demonstrated by laboratory tests made by the late Prof. Wallace C. Sabine, of Harvard University, and by many important installations.

Adaptability—Owing to its light weight (about 4 lb. per board foot) and facility of manufacture, AKOUSTOLITH is easily adapted to plain or elaborate architectural forms.

Texture—AKOUSTOLITH is made in a variety of textures, usually of a fine granular appearance, and can be made to closely resemble the usual building stone employed for interiors.

Permanency—The permanency of AKOUSTOLITH, owing to its composition of masonry, is assured. It will not disintegrate nor warp; moisture has no effect on its structure. It is genuine masonry, and non-combustible.

Color—AKOUSTOLITH is manufactured in a wide range of colors, ranging from gray white through

various shades of buff, brown, or any colors resembling those of building stones.

Stock Sizes—AKOUSTOLITH is manufactured in any size from the smaller tile dimensions—4x8, 5x10, 6x12, 8x16 and 10x20 in., all about 1 in. thick—to the larger ashlar sizes for wall work.

How It Is Installed—AKOUSTOLITH used on ceilings has primarily been installed in connection with our regular Guastavino arch construction, using it as a soffit course of tile and backing up the same with two or more layers of rough tile. It is, however, being largely used by applying it directly on the soffit of the concrete floor slabs, or wire lath and cement plaster ceilings.

For inside walls the installation can be made directly on any of the many masonry surfaces without scratch coat, if surface is reasonably true. In this case the material can be purchased f.o.b. factory and set by either the general contractor or his tile layer.

Akoustolith Plaster

AKOUSTOLITH PLASTER is a light weight masonry material used as a finish coat $\frac{1}{2}$ in. thick possessing a sound absorption of from .31 to .59 between the frequencies of 297 to 2890 vibrations per second—these values being many times greater than ordinary plaster.

Uses—AKOUSTOLITH PLASTER is used for the purpose of insuring correct acoustics in auditoriums and churches, also in hospitals, banks and offices, etc., where excessive reverberation would occur.

Color—AKOUSTOLITH PLASTER is a light gray color, almost white. If other colors are desired the usual mortar stains of any shade that the architect may select can be added by the plasterer. For tinting AKOUSTOLITH PLASTER after installation special instructions will be sent on request.

How Purchased—AKOUSTOLITH PLASTER is sold f.o.b. factory, packed in bags and ready for use with the addition of water only, and can be applied by any intelligent plasterer following the specifications and instructions furnished by the manufacturer.

Macoustic Material

Macoustic is mixed and applied in exactly the same manner as ordinary plaster, without special skill, by regular plastering contractor. Labor application cost is the same as for ordinary plaster. Macoustic has been used without basic change since 1921.

Method

Macoustic engineering recommendations, based upon definite established principles of sound direction and control, are proven correct by practical and successful application in all types, shapes, and sizes of interiors, under varying conditions, from coast to coast. Macoustic has eliminated guesswork.

Service

Macoustic treatment is adaptable to your own designs. The services of our Engineering Department are available without charge to architects, engineers, and others for analysis of plans and section drawings. Proper design and proportions plus Macoustic treatment produce maximum results.

Distinctive Macoustic Features

Practicability—Mixed and applied in exactly the same manner as ordinary plaster without special solutions or formulas or special skill.
Economy of Application—Applied for the same labor cost as ordinary plaster. Coverage, 100 yd. per ton.
Permanence—Becomes an integral, permanent part of the interior.
Decorative Appearance—Unlimited range of surface texture finishes in combination with harmonious color.
Fire Resistance—Macoustic is fire resistant and verminproof—not an added hazard.
Acoustical Effectiveness—Evidenced in actual practice by universally successful achievement.
Low Cost—The reasonable cost of Macoustic treatment places it within the reach of the smallest jobs, permitting a specification for Macoustic where otherwise this important consideration of good hearing would necessarily be eliminated.

Uses

For producing a correct acoustical condition in auditoriums of all sizes, churches and temples, theatres, music rooms and school classrooms, studios and recital rooms, lodge rooms, banquet rooms and courtrooms, corridors, banking rooms, workrooms, lobbies and concourses, library reading rooms, gymnasiums, natatoriums and recreation rooms.

MACOUSTIC

TRADE-MARK REGISTERED
 Patent Pending

Specifications

Use the following:

Macoustic Plaster manufactured by MACOUSTIC ENGINEERING COMPANY, INC., Bulkley Building, Cleveland, Ohio, to be applied on all surfaces specified and recommended by the Manufacturer's Engineering Department, and in accordance with their standard specifications.

Macoustic to be mixed with clean water and applied in the same manner as ordinary plaster, over a gypsum scratch or brown coat, and laid on to a depth of $\frac{1}{2}$ in. Produce specified surface texture finish.

Additional Data

Write for additional detailed literature or information, or send us plans for prompt analysis, followed by our acoustical engineering report with cost data covering each of your interiors.

Correct acoustics should and can be an accomplished fact before your final working drawings are completed.

UNITED STATES GYPSUM COMPANY

Sabinite Acoustical Plaster

Licensed Under Sabine Patent No. 1,458,631, June 12, 1923

300 West Adams Street

CHICAGO, ILL.

For Sales Offices, see page B1359

Product

SABINITE ACOUSTICAL PLASTER.

For Structolite Cement, see pages A44-45; for Floor Voids, see page A114; for Reinforced Roof Tile and Monolithic Floors and Roofs, see pages A166-170; for Dry Fill Insulation, see page A200; for Partition and Furring Tile, Beam and Column Covering, see pages A382-383; for Wallboard, see page B1258; for Sheathing, see page B1271; for Lath, see page B1323; for Gypsum Plasters and Finishes, see pages B1359-1361; for Colored Finishing Plaster, see page B1365; for Stucco, see page B1377; for Plastic Paint, see page B1697.

Sabinite Acoustical Plaster

Description—Sabinite Acoustical Plaster is the development of years of scientific effort toward the control of sound. It is the result of the research work of Dr. Paul E. Sabine, a recognized authority on acoustics, at the Riverbank Laboratories, Geneva, Illinois, which is known as the most complete acoustical laboratory in America.

Sabinite Acoustical Plaster is a gypsum material combining wonderful properties of sound absorption with the other qualities of a practical wall and ceiling plaster; it provides an economical, scientific solution of the problems of acoustics. It is mixed in the same manner and applied with the same tools as ordinary gypsum plaster.

Advantages—Sabinite Acoustical Plaster affords relief from the reverberation of sound from the usual hard, non-absorbent plastered walls found in modern

buildings, and overcomes the confusion caused by the intensity of a constant source of sound.

Sabinite absorbs from 15% to 40% of the sound that strikes it, depending upon the pitch, compared with 2% absorption by the ordinary plastered wall. Tests show that in a room plastered with Sabinite, sound is absorbed 6 to 18 times as quickly as in a room plastered with ordinary plaster. That is, if sound is produced in both rooms at the same rate, the average intensity in the room plastered with Sabinite is from one-sixth to one-eighteenth as great as the other. The effect of sound absorption is as if a heavy carpet were applied to walls and ceilings.

Section of Sabinite Wall Showing Porosity of Material

The reason for these remarkable results is that Sabinite is exceedingly porous, being filled with a multitude of connecting air spaces. Sound enters these small spaces, and through friction, is converted into heat—in other words, the sound is absorbed in the plaster.

Sabinite is as easily and quickly applied as any other gypsum plaster. It is gray-white in color and its finish is that of a sand float, providing a restful, attractive tone to walls and ceilings.

Where Sabinite May Be Used—Sabinite Acoustical Plaster is valuable in reducing excessive reverberation and resultant confusion of sound in theaters, churches, auditoriums and halls. It also decreases the intensity of sound from a constant source in any room—a condition found in any average office.

Sabinite transforms the walls of corridors in hospitals, hotels, apartments and office buildings—usually very noisy from the highly intensive sound-reflecting materials with which they are plastered—into “zones of quiet” at once restful and comfortable.

Note: See Special Bulletin and Direction Sheet for complete information and instructions for mixing and application and for the application of paint.

Covering Capacity—One ton of Sabinite, applied 1/2 in. thick will cover 60 sq. yd.

Package—Sabinite Acoustical Plaster is packed in 80-lb. paper bags.

WASHINGTON, D. C., W. LESTER BAKER, Peoples Life Insurance Building

Engineering Service

We offer, in addition to a sound-proofing system of wide scope, an engineering service to the architect and engineer. We are prepared to present suggestions and make recommendations on any sound-proofing problem that may arise in connection with any class of construction, and the architect and engineer are invited to call upon us at any time in order to avail themselves of this service. It is good policy to go into such matters at the time preliminary plans are being drawn, so that recommendations can be made before final details of construction are arranged.

This service is offered without charge and the recommendations being based on years of experience in this field, to which our entire time has been devoted, eliminates the necessity of working out experimentally such problems on a purely theoretical basis.

Eleven years of successful installations in all parts of the United States form the basis on which all recommendations and specifications are offered.

Advantages of Stevens System

Sound is an expansion and contraction of air, and travels in all directions in waves from the source of the sound. Where sound is disturbing within a room due to reverberation or echo, it is a simple matter to place absorbing materials in such a way that the sound will be partially absorbed and a large percentage of the echo eliminated.

Sound being a phenomena of the air, the problem becomes more complex when sound is transmitted from one closed room to another, as it is evident there is no passage of air.

It has been fairly well established that the transmission of sound from one room to another is caused by the movement or vibration of the structural parts of the building, which are set in motion by the sound and reproduces that sound wherever it comes in contact with air. Thus, a sound may carry indefinitely through a building, depending on the intensity of the sound and the resistance offered by the materials used in the building.

It is, therefore, evident that where absorbing materials are placed under floors or behind partitions or ceilings, that no matter how efficient they may be, that they can not function if the building is all tied together, as the sound will be transmitted by the steel, concrete or other materials.

The Stevens System provides a practical method of breaking the solid connection between the finished surfaces of a room and the substructures so that the surfaces exposed to the sound may vibrate or move without disturbing the substructure and by using proper absorbing materials in connection with the installation to absorb

the sounds produced by the diaphragmatic action of the finished surface.

Special Uses

In addition to using the system under floors, in partitions, in ceilings and under machinery to prevent passage of sound or vibration, it is also used under ballroom and gymnasium floors to provide resiliency and eliminate fatigue and shock of impact.

Some Installations

Adelphi Theater, Clark & Estes Avenue, Chicago, Ill., J. E. O. Pridmore, architect. Stevens System installed in 1917 in connection with six bowling alleys. Alleys placed on second floor over lobby of theatre and stores, and adjoining theatre auditorium.

Aeolian Hall, 54th Street and Fifth Avenue, New York, N. Y., Warren & Wetmore, architects. Three organ recital rooms. Stevens System used on floors, partitions and ceilings of organ chambers and recital rooms.

Roxy Theatre, Seventh and 50th Street, New York, N. Y., Walter Ahlslagier, architect. Ventilating fan and motor weighing 6 tons placed directly above the auditorium on Stevens anti-vibration platform.

Elks Club, Milwaukee, Wis., R. A. Messmer & Bro., architects. Ten bowling alleys placed on fourth floor directly above restaurant and directly under main lodge hall.

Stevens Hotel, Seventh Street and Michigan Avenue, Chicago, Ill., Holabird & Roche, architects. All ballroom and banquet room floors treated with Stevens System.

Edsel Ford Residence, Grosse Pointe, Mich., Albert Kahn, architect. All floors above first floor soundproofed under the Stevens System.

Fifth Avenue Theater, Seattle, Wash., R. C. Reamer, architect. Theater was built in connection with an office building, and each lease contained a clause stating that if sounds of theater organs are disturbing the lease may be broken. The two organ chambers were treated on ceilings, floors and partitions with entire satisfaction.

Grosse Pointe Country Club, Grosse Pointe, Mich., Smith, Hinchman and Gryls, architects. All floors treated with Stevens System.

Specifications

Furnish and install Stevens System of Sound-proofing as designed and manufactured by the STEVENS SOUND-PROOFING Co., Room 1190, 407 South Dearborn St., Chicago, Ill.

This system to be installed under the specifications and direction of the manufacturer.

Detailed Drawings, Stevens System of Floor Deadening

Detailed Drawings, Stevens System of Floor Deadening

Ordinary Construction: (1) Isolates upper floor from rough floor. Does away with all cutting by pipe trades. Eliminates all cutting of the floor plate; bridges all conduits. (2) Hold-down chairs for use where floors have a tendency to buckle, in center of rooms, etc.

Fireproof Construction: (1) Eliminates buckling of finished floors. Saves all cinder concrete fill. Conduits easily changed. Saves time. No waiting for the cinder concrete to dry. Hold-down chairs to prevent buckling floors.

MAURICE BLUMENTHAL & ASSOCIATES

Contracting Foundation Engineers

55 West 42nd Street

NEW YORK, N. Y.

Products and Services

We have the experience and organization necessary for the successful execution of difficult foundation work, specializing in:

STEEL TUBES TO ROCK, for foundations of new structures.

STEEL PILE UNDERPINNING, for underpinning existing structures to rock with steel tubes left in the ground.

Also Special Patented Concrete Piles to suit any soil conditions, concrete piers, etc.

Steel Tubes to Rock

Where foundations for new structures are to be driven in the open to rock we have developed our *steel tubes to rock* system.

This system possesses many advantages over the usual open cut methods. The chief of these are: greater speed in completing the job, saving in cost and working space required, greater flexibility.

Our wide experience in this class of construction is at your disposal both in furnishing preliminary suggestions and estimates and in the actual supervision and construction of the work.

Steel Pipe Underpinning

Some Advantages—Wherever it is necessary to underpin existing structures, such as heavy buildings, bridge piers, retaining walls, etc., due to settlement or the proximity of new construction, our steel pipe underpinning system will be found greatly superior to existing methods. This is especially true where rock is very deep, making it too costly and too dangerous to go down in open pits. Then again the speed with which the pipe can be driven as compared to the old method of excavating piers by hand, represents a great saving in time.

As compared to the use of compressed air caissons this method is much more flexible and far less expensive as it requires no compressor plant, air locks, etc.

Brief Description—In the Blumenthal method of steel pipe underpinning, the piles, consisting of sectional steel pipe filled with concrete, are sunk in the following manner.

A small pit is first dug and sheathed close to the wall of the structure to be underpinned. This pit is carried down until its bottom is several feet below the wall footing, then offset to get under the wall and continued far enough down to furnish a chamber having sufficient headroom to sink the sections of pipe.

The first length of pipe is then placed immediately below the point to be underpinned, a hydraulic jack is inserted between pipe and wall footing and the tubing is forced down into the soil. By inserting various sized wedging blocks jacking is continued until the first length of pipe is driven flush. A tapered cast steel collar is then fitted into the driven section, a second length of pipe set in place and driving continued.

After the first length of pipe has been driven a jet hose is inserted and during the jacking of all subsequent sections, the sand within the tubing is constantly stirred up and removed along with the water through the suction hose, as the pipe is sunk into place.

These operations continue until hard pan or rock is reached. The jack is then removed, the casing filled with concrete and after testing for straightness, load, etc., the finished pile is properly wedged up under the wall footing or grillage and the pit concreted and carefully grouted.

Where this method is used, the various piles to be driven can be placed in such a way as to provide distributed support to the structure during the entire process of underpinning.

In case where sufficient headroom is available, the hydraulic jack may be replaced with a drop hammer for driving.

SIMPLEX CONCRETE PILES: Cast-in-place, Pre-cast and Composite.

ENGINEERS and CONTRACTORS for CONCRETE CONSTRUCTION; ENGINEERS and CONTRACTORS for FOUNDATIONS for Chimneys, Tanks, Buildings, etc.; CAISSONS for CONCRETE CONSTRUCTION.

Also Steel Incased Concrete Piles.

We will submit recommendations, designs and estimates on receipt of necessary data, or will visit the site of prospective work at any time for purposes of investigation and consultation, and without obligation.

Specific Types of Piles for Specific Conditions

No one type of concrete pile has as yet been designed that will economically and successfully meet all conditions of soils and loadings. We have developed several methods of installing concrete piles enabling us to meet successfully every condition.

Simplex piles are of proven worth. They have been used extensively in the United States and Europe since 1903 for supporting buildings and other structures.

Advantages of Simplex Concrete Piles

Simplicity; easily and quickly installed	Durability equal to that of natural rock; renewals never required
Constant sectional area of 201 sq. in.; equal bulk of concrete for each foot of length	Greatest frictional surface
Certainty of results	Unsurpassed carrying power
Load transferred to firm bearing strata without reference to or dependence on poor soil above, although taking full advantage of it in addition to the end bearing value	Economy in time and cost over other types of foundations

Standard Simplex Cast-in-place Concrete Piles

Standard Simplex concrete piles are cast-in-place by driving to proper penetration a cylindrical steel driving form fitted at its lower end with a detachable cast iron base. The driving form is then filled with concrete to the necessary height and withdrawn, leaving the cast iron base in the ground with a column of concrete on top of it completely filling the hole to its compacted walls.

The concrete is placed before the removal of form.

In no case of Simplex pile construction has it been found that the back pressure of the earth was as great as the weight of the column of concrete in the pile.

Specifications—

General—Piles shall be made of concrete, cast-in-place, and shall be of the Standard Simplex type. Materials and workmanship shall in all respects comply with the requirements of the best engineering practice for such work. The contractor for piling shall furnish and install complete all piling shown on the drawings and called for in the specifications, and shall at all times co-operate with the other contractors doing work on the same project.

Driving Form—The driving form shall be of steel. It shall be cylindrical, and it shall be of sufficient thickness to withstand driving. Its outside diameter shall be the same as the diameter of the piles as shown on plans.

Base—Base shall be of Standard Simplex design and shall be made of cast iron. The joint between the driving form and the base shall, when necessary, be sealed to insure its being watertight.

Capacity—The piles are designed to carry a load of ... tons each.

Driving—Piles shall be driven by either a drop hammer, or a steam hammer, whichever in the contractor's opinion, is best suited to conditions. The depth to which the piles shall be driven shall be determined by the Engineering News Formula. Any pile driven to a penetration which gives the required capacity under the Engineering News Formula shall be considered to be a satisfactory pile, unless there is evidence to the contrary, or unless it has been agreed that some other means of determining the depth to which piles shall be driven is to be used.

Spacing—Piles shall be spaced a minimum of three feet (3 ft.) on centers, unless soil conditions permit of closer spacing.

Concrete—The concrete shall be mixed thoroughly and to proper consistency in the proportions as specified under general specifications for the work to be done, and shall be placed in such manner as not to disturb the proper distribution of the mixture.

Reinforcement—Reinforcement, if required, shall be placed within the tube after it has been driven to necessary penetration prior to the concrete being placed. Care shall be taken that no displacement of the reinforcement occurs.

Simplex Pre-cast Concrete Piles

Are used for foundations for docks, wharves, sea walls and other water work, and for foundations where the ground is unusually unsatisfactory. A form is driven to proper depth as in the standard system. A small amount of wet concrete is poured into the form. A pre-cast reinforced concrete pile is lowered through the form; the projecting ends of the reinforcement extend into the wet concrete. The form is then withdrawn, leaving the pre-cast pile in position. Thin grout poured into the form as it is withdrawn materially increases skin friction in some cases. This method admits of positive results as to penetration without striking a blow on the pre-cast pile and entirely avoids the questionable consequences of jetting.

Standard size is 13 in. octagonal section and 40 ft. in length, but can be installed in larger diameters and to greater depths.

Simplex Composite Piles

Economically meet soil conditions requiring great depth of penetration, where the permanent water line is considerably below the surface. A wood pile of required length and diameter is driven to proper depth, upon which is constructed a standard Simplex concrete pile. This method lends itself to the modifications of the standard system and readily admits the use of a pre-cast concrete pile on top of the wood pile.

MacARTHUR CAST-IN-PLACE PILES, including:

Straight Shaft and Pedestal Piles of uncased compressed concrete—up to 40 ft. in length.

Composite Piles of Concrete and Timber with cased or uncased concrete section—100 ft. in length.

Composite Piles with uncased upper section of compressed concrete and lower pipe section of any length.

Cased Concrete Piles with Pedestal—up to 40 ft. in length.

Pipe Piles with Cast Steel Point—filled with concrete to any length.

Concrete Slabs for Gas Holders.

"A Special Pile for Every Condition—Not One Pile for All Conditions."

Over 16 Years of Service to Architects and Engineers

For over sixteen years this Company has been successfully solving foundation problems which have confronted architects and engineers in charge of the erection of large buildings. During this time we have had to overcome many difficulties connected with unexpected subsoil conditions. Our experience has led us to appreciate the fact that very few building sites have the same formation throughout, variations occurring in most unexpected ways. As a result, we have developed a series of piles suited to the different soil conditions, but the method of forming them is such that they can be placed with our standard equipment. In this way, there is no delay incidental to bringing in equipment for special piles as the equipment is already on the site, and the material we use is available locally.

Modern Steel Pile Driving Equipment at Central Locations

Our equipment includes the most improved type of steel drivers and pile forming apparatus built to withstand the severest working conditions without breakdowns and consequent delays.

MacArthur Piles Excavated for Inspection
Made under supervision of Supt. of Building Dept., Borough of Brooklyn, N. Y.

MacArthur Modern Steel Pile Driving Equipment on a Job

Frequently unexpected conditions have arisen necessitating the completion of the job at an earlier date than had been anticipated. In these circumstances, we have aided the architect or engineer, and owner, by working double shift or by placing additional pile drivers on the site. This is always possible, as our equipment is held at strategically located points so as to be available for new work or emergencies which may arise in the performance of work already started.

Compressed Concrete Increases Bearing Power

The concrete in MacArthur Piles is mixed with just enough water to hydrate it and this is compacted into the soil under a pressure of 70 to 80 lb. per sq. in.

This compressed concrete is much denser than the surrounding soil and can not be distorted or forced out of place through the driving of adjacent piles, as might be the case with a wet uncompacted concrete even if protected by a thin metallic casing.

Hundreds of piles formed on 2-ft. 6-in. centers in the toughest and most rubbery of clays have been found to be absolutely perfect when excavated.

30 to 40 Tons Safely Carried on MacArthur Piles

Under the supervision and severe examinations of some of the foremost architects and engineers, it has been proven that 30 to 40 tons (depending on the nature of the soil) may be safely placed on MacArthur Piles.

A special feature of MacArthur Pedestal and Composite Piles, is the fact that they will withstand a considerable uplift. They have successfully withstood pulling strains up to 45 tons, when properly reinforced.

This feature proves very valuable when the piles are used as anchors to resist the effect of wind pressure, hydrostatic head or cantilever action on the pile footing.

Nine MacArthur Pile Drivers Quickly Finished This Foundation
A large public utility plant, where every day saved counted heavily

Specifications for the "MacArthur Method" of Placing Concrete Piles

No matter if the bearing stratum is as deep as 100 ft., the MacArthur Method will give you a pile with a safe load of 30 tons.

By specifying any type of "MacArthur" Pile by name the placing of the most suitable pile for the soil is assured, but should the use of a trade name not be desirable, the following alternate specifications (a) (b) (c) or (d) may be substituted.

Specification (a)

The concrete piles shall be cylindrical and formed of concrete having not more than a 1-in. slump, which has been compacted under a pressure of at least 70 lb. to the square inch. The pile form in which the concrete is placed shall previously have been driven to carry the required load, as indicated by the Engineering News Formula.

Specification (b)

Specification for Straight Shaft Piles—Piles shall consist of a cylindrical shaft of compressed concrete formed as follows: By driving a steel casing of [14] [15] [16] inches in diameter and close fitting core into the ground by means of a steamhammer until it indicates the required carrying capacity under the Engineering News Formula. The core shall then be withdrawn and the casing filled with concrete having a 1-in. slump. As the casing is withdrawn the full weight of the core and hammer shall rest on the concrete to compact it and force it into the soil.

Compressed Concrete Straight Shaft Type

Fig. 1. Core and casing driven into ground.
Fig. 2. Core removed and casing filled with concrete a sufficient amount above grade to take care of compression. The 7-ton weight of the core and hammer is then placed on the concrete.
Fig. 3. The casing is steadily withdrawn from the ground—the 7-ton weight of the core and steamhammer remaining constantly on the concrete and forcing it into the space occupied by the casing and any voids in the ground.
Fig. 4. The finished cylindrical shaft—a solid homogeneous mass of compressed concrete.

Specification (c)

Specification for Pedestal Piles—Pedestal piles shall consist of a cylindrical shaft of compressed concrete with an enlarged base formed as follows: By driving a steel casing of [14] [16] [18] inches in diameter and close fitting core into the ground by means of a steamhammer to desired depth.

The core shall then be withdrawn and a suitable charge of concrete placed in casing. The casing shall then be pulled up 18 in. to 3 ft. (depending on soil conditions).

The core shall then be replaced in casing and charge of concrete hammered out until about 6 in. remain in casing.

Note: If the ground is very soft it may be necessary to use a second charge. In no instance shall concrete be compressed so that less than 6 in. of concrete is in the casing.

The core shall then be withdrawn and the casing filled with concrete (having a 1-in. slump) to a height above required elevation of top of finished pile. Core shall then be replaced and the casing withdrawn. Full weight of core and hammer shall rest on the concrete while casing is being withdrawn.

Compressed Concrete Pedestal Type

Fig. 1. Core and casing driven into ground.
Fig. 2. Core removed, charge of concrete dropped to bottom of casing.
Fig. 3. Casing pulled up 18 in. to 3 ft. with 7-ton pressure of core and steamhammer remaining on concrete.
Fig. 4. Charge of concrete rammed out.
Fig. 5. Core is removed, casing filled with concrete. Core replaced and casing steadily withdrawn while concrete is under 7-ton pressure.
6. Finished shaft with enlarged base

Specification (d)

Specification for Composite Piles—Composite piles shall consist of a lower section of standard weight pipe closed at the lower end with a metal point and filled with concrete, or of a square timber, the upper section being of compressed concrete. The two sections shall be connected by a pedestal of hammered concrete. The completed pile shall have a safe working load of not less than 30 tons, and be formed as follows:

By driving the core and casing below water level. The lower section of pipe or timber shall be driven through the casing, giving perfect alignment until the necessary bearing is indicated under the Engineering News Formula. A charge of concrete shall then be hammered out to form a pedestal joint around the top of the lower section with a standard compressed concrete shaft to complete the pile.

Composite Type (Concrete and Wood Pile)

Fig. 1. Core and casing driven into ground.
Fig. 2. Core withdrawn and square timber placed in casing.
Fig. 3. Timber guided by casing, driven down to give necessary bearing. Butt of timber below ground water level. Core withdrawn.
Fig. 4. Casing raised necessary distance, pedestal joint formed batch of concrete deposited in casing on top of timber and core replaced around top of timber insuring perfect juncture between timber and concrete.
Fig. 5. Core withdrawn, sufficient concrete deposited to provide for voids and space occupied by casing. Casing then steadily withdrawn with 7-ton pressure remaining constantly on the concrete.
Fig. 6. Finished shaft well knitted and bonded to soil

RAYMOND STANDARD CAST-IN-PLACE CONCRETE PILES.

RAYMOND COMPOSITE (WOOD-CONCRETE) PILES.

RAYMOND PRE-CAST PILES: Bearing and Sheet.
CONCRETE WORK of a Special Nature.

Slogan

*A form for every pile—
A pile for every purpose.*

Concrete Piles vs. Wood Piles

There are certain fundamental advantages that concrete piles have over the use of wood piles. Wood piles must be driven so that the cut-off is below permanent water line, whereas concrete piles may be cut off at any level, irrespective of the permanent water line. Wood piles are often broomed or broken while being driven, thus reducing, if not eliminating their supporting power, whereas the Raymond type of concrete pile is not subject to distortion in driving.

In marine work, wood piles most frequently are creosoted for protection against marine borers, whereas concrete piles are not subject to such destruction. Wood piles very often require considerable shoring, underpinning, sheeting, pumping and deep excavation, whereas this can usually be eliminated partially, if not entirely, by the use of concrete piles. Furthermore, there is an important saving in time by the use of concrete piles, as the footings can be placed immediately after the concrete pile has been driven.

Classification of Concrete Piles

Concrete Piles are of two distinct types:

- (1) Concrete piles, which are made in place, commonly referred to as "cast-in-place" concrete piles.
- (2) Concrete piles which are cast in moulds and then driven like wooden piles and are referred to as "pre-cast" concrete piles.

Cast-in-place piles are divided into two classes:

- (a) Those in which a form is left in the ground to preserve the integrity of the finished pile.
- (b) Those in which the concrete is placed by means of a temporary driving form which is removed before the concrete hardens and leaves the pile confined only by the loose earth. The green concrete is then, obviously, subject to the admixture of foreign materials, excess of water and distortion due to strains set up by soil pressures and the driving of adjacent piles.

Pre-cast concrete piles are those which are cast in a mould and then driven like a wooden pile and are referred to frequently as "pre-cast concrete piles."

The Raymond Method

A collapsible steel core, usually 8-in. diam. at the point and increasing in diameter at the rate of 0.4 in. per lin. ft. of length, is incased by a spirally reinforced steel metal shell. The core, thus incased, is driven to a proper penetration in accordance with the *Engineering News* formula. It is then collapsed and withdrawn from the shell, the shell remaining in the ground and maintaining the resistance encountered in the driving. The shell is then inspected and if found perfect from tip to top is filled with concrete, making a perfect concrete pile.

Under certain conditions we use a core with a larger diameter at the point.

Loads and Spacing—Usually Raymond concrete piles are driven to carry a working load of 30 tons each, but in some cases, loads of from 35 to 40 tons are safely carried.

A working load of 30 tons per pile is accepted by all building departments. The usual spacing of Raymond concrete piles is 2 ft. 6-in. centers for piles less than 30 ft. in length, and for piles in excess of 30 ft. in length, a spacing of 3-ft. centers is more desirable. In view of the very wide variation in soil conditions and other difficulties surrounding a job, it is suggested that the nearest Raymond office be conferred with, so that the site can be investigated and recommendations made.

Sizes and Weight of Material—The standard Raymond concrete pile is installed by the use of a pile core 8-in. diam. at the point and increasing in diameter 0.4 in. per lin. ft. of length. For instance, a pile 20 ft. in length would be 16-in. diam. at the top, while one 37 ft. long would have a top diameter of 22.8 in.

Section of Spiral
Shell

Looking Down Into a Driven
Shell—30-ft. Long

The present limit in length of a standard Raymond concrete pile is 37 ft. 6 in. Where conditions are such as to require piles of greater length, we call attention particularly to the Raymond composite pile, a description of which will be found on the next page.

Working Loads—In calculating the resistance to penetration, the *Engineering News* formula, based on using a steam hammer, has been found most satisfactory. This formula follows:

$$L = \frac{2WH}{S + 0.1} \begin{cases} L = \text{Load in pounds} \\ W = \text{Weight of falling parts in pounds} \\ H = \text{Drop in feet of falling parts} \\ S = \text{Final penetration per blow in inches} \end{cases}$$

A No. 1 steam hammer has a weight of 5000 lb. falling 36 inches.

A No. 2 steam hammer has a weight of 3000 lb. falling 30 inches.

Thus the carrying capacity of the Raymond concrete pile is not a matter of guesswork or speculation, but is susceptible of computation and demonstration.

Advantages of Taper—The Raymond concrete pile possesses an extreme taper and offers a maximum resistance for a given length. This has been proved by a comprehensive record of resistance encountered in driving plus an extensive series of loading tests, during which the real carrying power of the pile has been checked with the driving resistance.

Prices—The Raymond concrete pile is "made-in place" and not sold by the foot, f. o. b. cars, consequently it is impossible to quote prices without knowing the conditions under which the work is to be done. For even approximate prices, it is necessary to have some knowledge of the number of piles, probable length, the approximate spacing, soil conditions, accessibility of the site, etc.

Points of Superiority of Raymond Concrete Piles—

(1) Absolute permanency: immunity from decay or from the attacks of wood borers and destroyers.

(2) Economy, because of greater carrying capacity—meaning a less number of piles for a given load. The greater carrying capacity rests upon several points—to wit:

(a) Greater size, therefore greater displacement and frictional area.

(b) Greater taper, therefore greater frictional value per square foot.

(c) Perfect shape, therefore perfect contact with the ground at every point.

(d) Possibility of inspection after driving, hence the ability to load to full capacity, instead of making a large allowance for inefficiency as in the case of wood piles subject to injury by overdriving, telescoping, departing from the vertical, and like defects, none of which are discernible at the moment when correction is possible.

(e) Decreased length of pile as a natural consequence of greater size and taper.

(3) Smaller and lighter footings, because of decreased number of piles.

(4) Decrease in total load to be carried, because of decreased weight of footings.

(5) Practical elimination of shoring, underpinning, sheeting, pumping and deep excavation and the reduction of masonry.

(6) Due to decreased number of piles and consequent reduction in width of wall footings, the center line of columns can be brought nearer to the building line.

(7) Important saving in time caused by:

(a) The smaller number of piles required.

(b) The reduction in the amount of excavation, shoring, sheeting and pumping.

(c) The reduction in quantities of footing or masonry.

(d) Manufacture of the pile in place, from materials readily procurable in all localities, and limit of manufacture to the actual number and exact length of piles required. There is no delay for cutting and trimming trees, hauling to shipping point, transporting for great distances by rail or water and delivery to the job, perhaps only to find that the piles are too long or too short.

Specification—If "Raymond concrete piles" are called for, this is of course sufficient. On the other hand, if it is for any reason inadvisable to name them specifically the following specifications will cover:

"Concrete piles shall be of a type specifically approved by the architect or engineer, and shall be placed in the following manner:

"A collapsible steel mandrel or pile core 8 in. in diameter at the small end and 20 in. in diameter 30 ft. from that point shall be incased in a spirally reinforced steel shell and driven to a proper penetration. The pile core shall then be collapsed and withdrawn from the shell. Before placing the concrete, each shell shall be inspected and, being found perfect, shall thereupon be filled with concrete placed in accordance with the best practice."

or

"Moulded-in-place piles shall be of a type suitable for the conditions and subject to the approval of the architect or engineer. They shall be formed in casings left in place, which shall be of sufficient strength to prevent distortion or bulging after mandrel has been withdrawn and while the cavity is being filled with concrete or during the driving of adjacent casings."

Essential Steps in the Making of a Raymond Concrete Pile

More About the Raymond "Cast-in-place" Pile

The Raymond pile is the only concrete pile employing the spirally reinforced driven casing as a permanent form to remain in the ground. This feature is essential for perfect dependable results. The province of the form or shell is manifold:

- (1) To serve as a form for the piles.
- (2) To prevent the admixture of foreign substances.
- (3) To retain the original moisture in the mixture until the concrete is thoroughly hardened.
- (4) To prevent distortion by external pressure, due to the driving of adjacent piles or accumulated pressures from displacement by the pile itself.
- (5) To perfectly retain the displaced earth forming the walls of the cavity, so that there may be no relaxation of the ground and therefore no loss of resistance when the displacing force (the core) is removed.
- (6) To act as reinforcement of the pile until the concrete shall have attained its maximum strength.

Raymond Composite Piles

For use where depths greater than 37 ft. 6 in. are encountered, we have developed a composite pile made up by superimposing a Raymond concrete section on a previously driven wooden pile.

The wood pile is ultimately driven so that its top is below the permanent water level and from that point to the bottom of the footing is a standard Raymond Concrete pile, as fully illustrated below.

Pre-cast Piles

Pre-cast piles have a large and useful field, particularly in marine structures, such as docks, bulkheads, etc.

Raymond Composite Pile

The RAYMOND CONCRETE PILE COMPANY is prepared, through its experience, to give good advice upon the use of "pre-cast piles," and also to design and construct work in which a pre-cast pile can be used economically and advantageously.

Special Concrete Construction

In addition to the placing of standard Raymond concrete piles for foundation of structures on land, we construct and design permanent docks, piers, bulkheads, trestles, storage bins, retaining walls, bridges, heavy foundation, shipways, drydocks, etc.

Each problem requires special study for solution and our experienced organization is yours to command.

Services and Facilities

Our staff of experts is at your service, to assist in the designing and installation of concrete piles for all purposes and to meet all conditions.

Engineering—Our engineering department is available to architects and engineers at all times for investigation work and consultation, and we will gladly submit recommendations, designs and estimates covering any problem within the scope of our business.

Equipment—Every Raymond driver is built of structural steel, scientifically designed for the most rapid and economical construction, and the major portion of our equipment is built in our own machineshops.

References

Since 1901 when the first Raymond concrete pile was placed, we have placed up to December, 1926, more than 24,000,000 ft. of Raymond concrete piles throughout the United States, covered by over 2000 separate and individual contracts. We will be only too glad to have you refer to any of the many engineers, architects, owners, and general contractors with whom we have been associated.

WESTERN FOUNDATION COMPANY

Engineers and Contractors

30 North La Salle Street
CHICAGO, ILL.

Products

FOUNDATIONS of all types.
PILES.
CAISSONS.

Foundations of All Types

Where the soil conditions are such as to require special foundations the WESTERN FOUNDATION COMPANY finds its field of activity. We are prepared to discuss with architects and engineers any standard type of foundations, i.e., concrete piles, composite piles, caissons, steel pipe piles, wood piles and steel and wood sheeting.

Our Service

Being prepared to execute any type of foundation work, we are enabled to install not one particular type of foundation on a given job but the most economical type for the soil conditions. It sometimes happens that on a single job several types of foundations are desirable. In one recent job, there were piers, open caissons, blown-out steel pipes, compressed concrete piles, composite piles and wood piles, all of these being carried to rock, which in one part of the building was above the water line and in another part below the water line.

Being prepared to execute various types of foundations, we are also in a position to discuss with architects and engineers the cost of various types. Our engineers have had many years of experience in foundation work. We are very glad to have them call upon architects and discuss with them their foundation problems when they are studying a job and making preliminary cost estimates, so that the most economical type of foundation can be determined and the plans prepared accordingly.

Our Concrete Piles

Experience has shown that satisfactory results with concrete piles cannot be obtained by using the same type of pile for all soil conditions. In some cases the compressed type of pile is the most satisfactory. In other cases the soil is such that it is desirable to protect the concrete with a metal casing. In some other soils it is desirable to make a pile with an enlarged base so that the load may be carried through a soft stratum on to a firm stratum. Again the load conditions may be such that a pile of small diameter will be entirely satisfactory, or the load may be so great that it is necessary to have a pile of large diameter in order to keep the stresses in the concrete within safe limits.

All of these varying conditions can be and have been taken care of by us in an economical and satisfactory manner.

Who Is The Western Foundation Company and What Do They Do?

The WESTERN FOUNDATION COMPANY is a new company, having been incorporated in 1924. It is made up of men who have had many years of experience in foundation and structural work—consequently the plant and equipment is thoroughly modern and has many new

features. Our first job was started in October, 1924. We have had work for the following to whom we would refer any one that may be interested:

Architects

Alfred S. Alschuler, 28 East Jackson Boulevard, Chicago, Ill.
John Archibald Armstrong, 127 No. Dearborn Street, Chicago, Ill.
Bennett, Parsons & Frost, 80 E. Jackson Boulevard, Chicago, Ill.
Condron & Post, 53 W. Jackson Boulevard, Chicago, Ill.—2 jobs
Folz & Brand, 510 No. Dearborn Street, Chicago, Ill.
Graham, Anderson, Probst & White, 80 E. Jackson Boulevard, Chicago, Ill.—2 jobs
Harry Hake, 2400 Gilbert Avenue, Cincinnati, Ohio
Holabird & Roche, 104 So. Michigan Avenue, Chicago, Ill.
Albert Kahn, Marquette Building, Detroit, Mich.
Kirchoff & Rose, 210 Sycamore Street, Milwaukee, Wis.
M. J. Morehouse, 343 So. Dearborn Street, Chicago, Ill.
Smith, Hinchman & Grylls, Marquette Building, Detroit, Mich.
Thielbar & Fugard, 219 E. Superior Street, Chicago, Ill.

Contractors

Austin Co., W. 60th and So. 48th Street, Chicago, Ill.
Avery Brundage, 110 So. Dearborn Street, Chicago, Ill.—3 jobs
William Baehr Organization, 232 So. Clark Street, Chicago, Ill.
Carmichael Construction Co., Akron, Ohio
Contracting & Materials Co., 42 E. Pearson Street, Chicago, Ill.
Ferro Concrete Construction Co., Third and Elm Streets, Cincinnati, Ohio
John Griffiths, Builders Building, Chicago, Ill.—2 jobs
Hegeman-Harris Co., Tribune Building, Chicago, Ill.
J. H. Johnson, 612 No. Michigan Avenue, Chicago, Ill.
Kelly-Atkinson Construction Co., 189 W. Madison Street, Chicago, Ill.—2 jobs
M. A. Long Co., 332 So. La Salle Street, Chicago, Ill.
MacDonald Engineering Co., 53 W. Jackson Boulevard, Chicago, Ill.—4 jobs
Mutual Construction Co., 2532 Warren Avenue, Chicago, Ill.
South Parks Board, Linn White, Chief Engineer, 57th and Cottage Grove Avenue, Chicago, Ill.—11 jobs
Turner Construction Co., 6 No. Michigan Avenue, Chicago, Ill.
R. C. Wieboldt Co., 1534 Van Buren Street, Chicago, Ill.—3 jobs

Owners

Alpha Portland Cement Co., Easton, Pa.
Battle Creek Gas Co., Battle Creek, Mich.—2 jobs
Battle Creek Sanitarium, Battle Creek, Mich.
Sanitary District of Chicago, 910 So. Michigan Avenue, Chicago, Ill.
Eckhart Milling Co., 1320 Carroll Avenue, Chicago, Ill.
Evansville Portland Cement Co., Catasauqua, Pa.
Ford Motor Co., Detroit, Mich.—2 jobs
W. H. Holliday Co., Indianapolis, Ind.—2 jobs
International Portland Cement Co., New York, N. Y.
May Company Department Store, Akron, Ohio
Michigan Bell Telephone Co., Flint, Mich.
National Biscuit Co., 110 No. Morgan Avenue, Chicago, Ill.
North Shore Coke & Chemical Co., Waukegan, Ill.
Pittsburgh Plate Glass Co., Oregon and Barclay Streets, Milwaukee, Wis.
Union Stock Yards Co., Cincinnati, Ohio

We would call particular attention to the fact that, although we have been operating less than three years, we have had many repeat orders. Notice the number of jobs we have had with the same owners, architects and contractors.

In many cases, after we have had one job, we have been given the second and succeeding jobs without competition. This can mean but one thing—satisfaction.

Purpose

The Portland Cement Association is a national organization to improve and extend the uses of concrete.

This phrase states in formal language the purpose of the PORTLAND CEMENT ASSOCIATION. It is a service organization, supported by the manufacturers of portland cement, for the benefit of users and prospective users of concrete.

In November, 1927, the Association will complete twenty-five years of existence. Since 1915, its service has been available on a truly national scale.

Concrete is a basic material in nearly every form

of construction. Research has developed the laws which control the strength of concrete, as well as other important characteristics. Inventive craftsmanship has developed applications of concrete for artistic decoration which were unknown a few years ago. An attempt has been made to convey brief and somewhat general information about these fundamental laws and new applications in the four pages following.

It is impossible in this limited space to present all of the information that may be desired. Inquiries for more complete data are invited, and may be addressed to the nearest district office in the list given on this page.

STANDARD SPECIFICATIONS FOR PORTLAND CEMENT

A.S.T.M. Serial Designation: C 9-26

Definition

(1) Portland cement is the product obtained by finely pulverizing clinker produced by calcining to incipient fusion an intimate and properly proportioned mixture of argillaceous and calcareous materials, with no additions subsequent to calcination excepting water and calcined or uncalcined gypsum.

I. Chemical Properties

- (2) The following limits shall not be exceeded:
- | | |
|---|------|
| Loss on ignition, per cent..... | 4.00 |
| Insoluble residue, per cent..... | 0.85 |
| Sulphuric anhydride (SO ₃), per cent..... | 2.00 |
| Magnesia (MgO), per cent..... | 5.00 |

II. Physical Properties

(3) The residue on a standard No. 200 sieve shall not exceed 22 per cent by weight.

(4) A pat of neat cement shall remain firm and hard, and show no signs of distortion, cracking, checking, or disintegration in the steam test for soundness.

(5) The cement shall not develop initial set in less than 45 minutes when the Vicat needle is used or 60 minutes when the Gillmore needle is used. Final set shall be attained within 10 hours.

(6) The average tensile strength in pounds per square inch of not less than three standard mortar briquets (see Section 47) composed of one part of cement and three parts of standard sand, by weight, shall be equal to or higher than the following:

Age at test, days	Storage of briquets	Tensile strength, lb. per sq. in.
7	1 day in moist air, 6 days in water	225
28	1 day in moist air, 27 days in water	325

(7) The average tensile strength of standard mortar at 28 days shall be higher than the strength at 7 days.

III. Packing, Marking and Storage

(8) The cement shall be delivered in packages as specified with the brand and name of the manufacturer plainly marked thereon, unless shipped in bulk. When shipped in bulk, this information shall be contained in the shipping advices accom-

panying the shipment. A bag shall contain 94 lb. net. A barrel shall contain 376 lb. net. All packages shall be in good condition at the time of inspection.

(9) The cement shall be stored in such a manner as to permit easy access for proper inspection and identification of each shipment, and in a suitable weather-tight building which will protect the cement from dampness.

IV. Inspection

(10) Every facility shall be provided the purchaser for careful sampling and inspection at either the mill or at the site of the work, as may be specified by the purchaser. At least 12 days from the time of sampling shall be allowed for the completion of the 7-day test, and at least 33 days shall be allowed for the completion of the 28-day test. The cement shall be tested in accordance with the methods hereinafter prescribed. The 28-day test need not be made if waived by the purchaser.

V. Rejection

(11) The cement may be rejected if it fails to meet any of the requirements of these specifications.

(12) Cement remaining in storage prior to shipment for a period greater than 6 months after test shall be retested and shall be rejected if it fails to meet any of the requirements of these specifications.

(13) Cement shall not be rejected on account of failure to meet the fineness requirements if upon retest after drying at 100° C. for one hour it meets this requirement.

(14) Cement failing to meet the test for soundness in steam may be accepted if it passes a retest using a new sample at any time within 28 days thereafter. The provisional acceptance of the cement at the mill shall not deprive the purchaser of the right of rejection on a retest of soundness and time of setting at the time of delivery of cement to the purchaser.

(15) Packages varying more than 5 per cent from the specified weight may be rejected; and if the average weight of packages in any shipment, as shown by weighing 50 packages taken at random, is less than that specified, the entire shipment may be rejected.

Note: The American Society for Testing Materials, 1315 Spruce Street, Philadelphia, Pa., will furnish complete information on the standard tests and test methods for determining physical and chemical properties of Portland cement. Our booklet "Standard Specifications and Tests for Portland Cement" also gives this information and may be obtained by addressing our nearest district office.

PORTLAND CEMENT CONCRETE

Proportioning Concrete

Extensive research in the past 10 to 15 years has resulted in a new method of proportioning concrete mixtures by which it is possible to design mixes that will have definite strengths and other qualities. It has been found that for given materials and methods of manipulation, the strength, watertightness and ability to withstand weathering depend upon the amount of mixing water used. The less mixing water used the stronger will be the concrete and the more watertight and weather resistant. The mixtures must be workable, completely filling the forms and surrounding the reinforcement without excessive spading. With fixed quantities of cement and water the amount and proportions of aggregates may be adjusted to give the workability necessary for the particular job without affecting the strength so long as the mixture is plastic. This discovery has led to the water-cement ratio specification for concrete, given below in abbreviated form:

Specifications for Concrete

Water-Cement Ratio—Concrete shall be proportioned to give the necessary workability without exceeding the quantities of mixing water given in the following table:

Class of Concrete	Desired compressive strength at 28 days, lb. per sq. in.	Maximum quantity of mixing water, U. S. gal. per sack cement
A ¹	3000	6
B ²	2500	6¾
C ³	2000	7½
D ⁴	1500	8¾

¹Suitable for roadways, piles, pressure pipe, tanks, thin structural members and walls, dams, piers, etc., exposed to severe action of water and frost.

²Suitable for sewers, bridges, walls, dams, piers, etc., subject to moderate action of water and frost.

³Suitable for ordinary reinforced concrete buildings. Bridges and retaining walls of heavy section in moderate exposure.

⁴Suitable for mass concrete, basement walls, etc., protected from water or severe weather conditions.

These water-cement ratios are the maximum permissible. The mixes shall be proportioned for somewhat lower ratios so that with the normal fluctuations from batch-to-batch these ratios will not be exceeded. Moisture held by the aggregate must be included in computing the water-cement ratios. Water absorbed by the aggregate in a period of 30 minutes may be deducted in computing the water-cement ratio.

Change of Water-Cement Ratio—The water-cement ratios specified shall not be changed except by the Engineer. In the event that the Engineer finds it necessary to change the water-cement ratios from those specified, adjustment covering amount of cement and aggregates affected will be made as an extra or a credit under the provisions of the contract.

Measuring Moisture in the Aggregate—Moisture in the aggregate shall be measured by a method satisfactory to the

Engineer, which will give results within 1 lb. for each 100 lb. of aggregate.

Concrete Consistency—The proportions of aggregate to cement for concrete of the water-cement ratios specified shall be such as to produce concrete that can be puddled readily into the corners and angles of the form and around the reinforcement without excessive spading and without segregation or undue accumulation of water or laitance on the surface. In no case shall concrete be placed which shows a slump outside of the following limits:

Part of structure	Slump, inches	
	Minimum	Maximum
Caissons.....	1	4
Heavy walls, slabs, beams.....	3	7
Thin walls and columns.....	4	8
Pavements.....	1	3

Proportions of Aggregate—The proportion of fine and coarse aggregate shall be such that the ratio of the coarse to the fine shall not be less than—*nor more than—*nor shall the amount of coarse material be such as to produce harshness in placing or honeycombing in the structure. When forms are removed, the surface and corners of the members shall be smooth and sound throughout.

Note: *The following limits in the proportion of coarse to fine aggregate are suggested:

Maximum size of coarse aggregate, inches	Ratio of coarse to fine aggregate on basis of dry and rodded volumes	
	Minimum	Maximum
$\frac{3}{8}$	0.4	0.8
$\frac{1}{2}$	0.6	1.5
1 and over	1.0	2.0

Control of Proportions—The methods of measuring materials shall be such that the proportion of water to cement can be closely controlled during the progress of the work and easily checked at any time by the Engineer or his representative. To avoid unnecessary or haphazard changes in consistency, the aggregates shall be obtained from a source which will insure uniform quality and grading during any single day's operation, and they shall be delivered to the work and handled in such a manner that variations in moisture content will not interfere with the steady production of concrete of a reasonable degree of uniformity.

High Early Strength Concrete

The element of time is often important in concrete work. Certain operations such as repairing cuts in pavement slabs, made necessary by water or sewer construction, require high early strengths in the concrete. Portland cement meeting standard specifications will produce concrete of the desired strength by variation in the quantity and proportions of the materials, including the water, and by adjusting the methods of placing and curing to the needs of the work under consideration.

The table shows the increase in strength that results from reducing quantity of mixing water and corresponding increase in quantity of cement to maintain same consistency. With some cements the use of 2 lb. of flake calcium chloride with each sack will add further to early strength. This should not be depended upon unless proven by test that the given cement will react in this manner.

Increasing the mixing time to 2 minutes will add about 100 lb. per sq. in. to the strength of all mixes at 3 days and 5 minutes mixing will add 200 lb. per sq. in. The factors which will increase strength at early ages are:

- (1) Decrease amount of mixing water,
- (2) Increase mixing time up to 5 minutes,

Concrete Floor Finish

The installation of concrete floor finishes should be entrusted only to the competent floor contractor where uniformly hard, dense and durable surfaces are desired. The variables that make up a job must be constantly controlled to get satisfactory results. Aggregates must be chosen with regard to gradation, cleanness and

Tests of Concrete—Frequent tests may be made by the Engineer throughout the work to determine the quality of concrete. These tests will be made at the expense of the owner, and will, in general, be made on 6 by 12-in. concrete cylinders loaded in compression at 7 and 28 days, in accordance with the Standard Method of Making and Storing Specimens of Concrete in the Field (Serial Designation: C31-21) of the American Society for Testing Materials.

Co-operation of Contractor—The contractor shall co-operate in every way to the end that concrete of the desired quality be obtained. He shall provide, at cost, such housing as may be required for testing equipment and storage of test specimens; such cost to include only labor and materials actually used.

Mixing Concrete—The concrete shall be thoroughly mixed in a batch mixer of approved type. The mixer shall be equipped with suitable charging hopper. A water-storage and water-measuring device shall be provided. The mixing of each batch shall continue for at least one minute after all the materials are in the mixer during which time the mixer shall rotate at a peripheral speed of approximately 200 ft. per minute.

Depositing Concrete—Concrete shall be handled from the mixer to place as rapidly as practicable and in a manner that will prevent segregation of the ingredients. It shall be deposited in the forms as nearly as practicable in its final position to avoid rehandling. Concrete as it is deposited shall be puddled with suitable tools until forms are completely filled and reinforcement and embedded fixtures thoroughly incorporated in the mass.

Concrete shall be deposited continuously and as rapidly as practicable until the unit of operation, approved by the Engineer, is completed.

Concrete when deposited shall have a temperature of not less than 40° F. and not more than 120° F. In freezing weather suitable means shall be provided for maintaining the concrete at a temperature of at least 50° F. for 72 hours or more after placing, or until the concrete has thoroughly hardened. The methods of heating the materials and protecting the concrete shall be approved by the Engineer. Salt, chemicals, or other foreign materials shall not be mixed with the concrete for the purpose of preventing freezing.

Protection of Concrete—Exposed surfaces of concrete shall be protected from drying for a period of at least 7 days after being deposited.

TABLE OF BASIC MIXTURES

Based on 70° F. minimum temperature of concrete when placed and during curing and a minimum time of mixing of 1 minute

Refer. No.	Typical mixes (illustrating range for aggregates used in this test)		Water-cement ratio, (gal. per sack)	Slump in.	Compressive strength (cured wet until test)			
	Mix	Cement, (bbl. per cu. yd.)			1 da.	3 da.	7 da.	28 da.
1	1:2:3½	1.40	7½	6-7	100	500	1100	2000
2	1:2:3½	1.40	6½	2-4	230	830	1530	2600
3	1:2:3½	1.40	6	½	300	1000	1800	3000
4	1:1½:3	1.65	6	6-7	300	1000	1800	3000
5	1:1½:3	1.65	5½	2-4	370	1230	2070	3400
6	1:1½:3	1.65	5	½	470	1500	2400	3900
7	1:1:2	2.25	5	6-7	470	1500	2400	3900
8	1:1:2	2.25	4½	2-4	600	1800	2800	4300
9	1:1:2	2.25	4	½	830	2130	3170	4900

Note: In calculating water-cement ratio, free water or moisture carried by aggregates must be included; water absorbed by dry aggregates may be deducted. Slumps, mixes and cement quantities given above are for illustration only and are accurate only for the particular aggregates used in these tests.

hardness. Mixing water must be reduced to a minimum to produce the strongest concrete. Curing with plenty of water is absolutely necessary. Faulty and excessive troweling must be eliminated. These are the fundamental principles of good floor finish. If they are ignored, soft, porous, short-lived floors will usually

result. Sloppy, soupy concrete, fine grained aggregates, improper troweling and total omission of proper curing account for practically all floor troubles.

Specification for 1-inch Bonded (Two Course) Concrete Floor Finish for an Office Building

Slab Level—The structural slab surfaces shall be reasonably true and struck off at a level approximately 1 in. below the finished floor level.

Brooming—As soon as the concrete base permits, all laitance, scum, dirt and loose aggregate shall be removed from the surface by means of a steel broom. Smearing of concrete indicates that it is still too soft. Brooming shall leave the surface clean and rough to insure thorough bond of finish.

Chipping—When it is impossible to cut off laitance and roughen the slab prior to the final set of the cement, the surface shall be cleaned and prepared for bond by mechanical chipping.

Grouting—The slab shall be thoroughly wet, but free from pools of water. A thin coat of neat cement grout shall

be thoroughly broomed into the surface of the slab just prior to the application of the wearing course.

Mix—The mix shall be 1 part of portland cement, 1 part of coarse, clean, torpedo sand, and 1½ parts of hard, clean pea gravel or crushed stone (¾ to ½ in.).

Consistency—The concrete shall be of the driest consistency possible to work with a sawing motion of the strike-off board.

Finishing—After striking off the wearing course to the established grade, it shall be compacted with a wood float. From time to time, the surface shall be tested with a straight-edge to prevent high and low spots. The concrete shall be floated so as to yield a surface free from depressions or irregularities of any kind. This floating shall be followed by steel troweling to bring the finish to a smooth surface free from marks and blemishes. In no case shall dry cement or a mixture of dry cement and sand be sprinkled on the surface of the wearing course to absorb moisture or to hasten the hardening.

Curing—Within 24 to 36 hours after the final troweling, the finished surface shall be covered with a layer of sand or sawdust which shall be kept wet by sprinkling with water for at least 10 days.

SPECIFICATIONS FOR CONCRETE BUILDING BLOCK AND CONCRETE BUILDING TILE

I. General

(1) The purpose of these specifications is to define the requirements for concrete building block and concrete building tile to be used in construction.

(2) The word "concrete" shall be understood to mean Portland cement concrete.

II. Classification

(3) According to the strength in compression 28 days after being manufactured or when shipped, concrete block and concrete tile shall be classified as heavy load bearing, load bearing, and non-load bearing on the basis of the following requirements:

Name of classification	Compressive strength, lb. per sq. in. of gross cross-sectional area as laid in the wall	
	Aver. of 3 or more units	Min. for individual unit
Heavy load bearing block or tile...	1200	1000
Medium load bearing block or tile...	700	600
Non-load bearing block or tile.....	250	200

(4) The gross cross-sectional area of a one-piece concrete block or tile shall be considered as the product of the length times the width of the unit as laid in the wall. No allowance shall be made for air spaces in hollow units. The gross cross-sectional area of each unit of a two-piece block or tile shall

be considered the product of the length of the unit times one-half the thickness of the wall for which the two-piece block or tile is intended.

III. Requirements

(5) The compressive strength of the concrete in units of all classifications except "non-load bearing block" shall be at least 1000 lb. per sq. in., when calculated on the minimum cross-sectional area in bearing.

(6) Concrete building block and tile to be exposed to soil or weather in the finished work (without stucco, plaster or other suitable protective covering) shall meet the requirements of the absorption test.

(7) All concrete building block and tile not covered by Paragraph 6 need not meet an absorption requirement.

(8) Concrete block and tile shall not absorb more than 10 per cent of the dry weight of the unit when tested as hereinafter specified, except when it is made of concrete weighing less than 140 lb. per cu. ft. For block or tile made with concrete weighing less than 140 lb. per cu. ft. the absorption in per cent by weight shall not be more than 10 multiplied by 140 and divided by the unit weight in pounds per cubic foot of the concrete under consideration.

(9) Specimens for tests shall be representative of the commercial product of the plant.

(10) Not less than three and preferably five specimens shall be required for each test.

(11) The specimens used in the absorption test may be used for the strength test.

CONDENSED SPECIFICATIONS FOR PORTLAND CEMENT STUCCO

General

Preparation of Backing Surface—The backing surface of whatever type, shall provide clean, rough surfaces and good mechanical bond for the stucco, and shall be thoroughly cleaned before the application of stucco; all hangers, fasteners, trim or other fixed supports, or projections of any kind, shall be in place before stucco is applied. Masonry walls shall be properly wetted before the application of the scratch coat. Flashing shall be applied at all points where it would prevent water from getting behind the stucco.

Materials

Cement—Portland cement shall conform to the requirements of the latest standard specifications of the American Society for Testing Materials.

Fine Aggregate—Fine aggregate shall consist of clean sand, or screenings from crushed stone or pebbles, graded from fine to coarse, passing when dry a No. 8 screen, free from dust or other deleterious materials.

Water—Water shall be clean, free from oil, acid, strong alkali or vegetable matter.

Coloring Materials—Only permanent mineral oxides that are fully guaranteed by the manufacturer to be unaffected by

lime, cement or weather, and in amounts not to exceed 10 per cent of the weight of the cement shall be used as coloring matter.

Hydrated Lime—Hydrated lime shall meet the requirements of the standard specifications of the American Society for Testing Materials and shall be used in quantity not to exceed one-fifth the volume of cement.

Construction

Proportions—The proportions for all coats shall be 1 bag of cement to 3 cu. ft. of sand to which may be added hydrated lime in an amount not exceeding one-fifth the volume of cement. In these proportions 1 cu. ft. (1 bag) of cement weighs 94 lb. net and 1 cu. ft. of hydrated lime weighs 40 lb.

Mixing—The ingredients of the stucco shall be thoroughly mixed, preferably in a machine mixer of the rotating drum type, for at least five minutes after all materials are in the drum. The quantity of water shall be determined by trial and thereafter measured in proper proportion.

Masonry Walls—Concrete, concrete block, brick, hollow tile and similar walls shall be rigid and constructed upon solid footings, all units being set in portland cement mortar. The surface on which stucco is to be applied shall be clean, free from all dust, dirt or loose particles, preferably rough and of coarse texture. Wood lintels over wall openings shall not be used. Monolithic concrete walls shall be roughened by hacking, wire brushing or other effective means. Concrete block, tile or brick units shall have the joints cut back even with the surface.

Framing—Spacing of studs shall not exceed 16 in. Stud-
ding shall run from foundation to rafters without intervening
horizontal members, tied together below second floor joists with
1x4-in. boards let into the inner faces of the studs. In open
construction without sheathing, the spacing of studs shall not
exceed 12 in. The corners of all walls shall be braced diagonally
to secure the necessary rigidity of the structure. Bridging
of studding with 2x4-in. braces shall occur at least once in each
story height.

Sheathing—Sheathing boards shall not be less than 6 in.
nor more than 8 in. wide, dressed to a uniform thickness, laid
horizontally and fastened securely to each stud. Over the
sheathing shall be laid, horizontally, beginning at the bottom,
any standard asphalt saturated roofing felt weighing 15 lb. per
square, the bottom layer lapping the baseboard and each strip
lapping the strip below and all flashing at least 2 in.

Application of Reinforcement—Reinforcement shall be
placed horizontally, fastened with approved furring devices not
more than 8 in. apart over the surface. Vertical laps shall occur
at supports, horizontal joints being lapped and tightly laced with
18 gauge annealed wire. The sheets shall be returned around
corners at least 4 in. in sheathed construction and 16 in. in
open construction. Corner beads shall not be used.

Furring—All reinforcement shall be furred out from the
studs, sheathing or base $\frac{3}{8}$ in. by any device which will not
reduce the effective section of the scratch coat.

Half-timbering—Embedded trim or half-timbering shall
be securely nailed directly upon sheathing or studs, and shall
have the inside corners of vertical members grooved into which
the mortar of the first coat shall be forced forming a water-
tight joint. All joints on horizontal members shall be flashed.

Application of Stucco Coats on Frame Construction—
The application shall be carried on continuously in one general
direction without allowing the stucco to dry at the edges. If

it is impossible to work the full width of the wall at one time
the joining shall be at some natural division of the surface,
such as a window or door. The scratch coat shall be shoved
thoroughly through the metal reinforcement forming a solid
mass against the sheathing paper, thus completely encasing the
metal. This coat shall be $\frac{1}{2}$ in. thick fully covering the face of the
reinforcement and shall have its surface heavily cross scratched
to provide a strong mechanical key or bond. Allow this coat
to become thoroughly dry. It shall be wet down but not satur-
ated before applying the second coat. The second or browning
coat shall be at least $\frac{1}{2}$ in. thick over the face of the first coat
and shall be rodged straight and true in every direction, or left
untrue giving a wavy effect, as the desired finish would suggest.
If the finish is to be a float type finish, the second coat shall be
brought to a good even surface with wood floats. This coat
shall be wet down for at least three days and allowed to become
thoroughly dry before the finishing coat is applied. The finish
coat shall be applied not less than one week after the applica-
tion of the second coat and shall vary in thickness from $\frac{1}{8}$ to
 $\frac{1}{4}$ in., depending upon the texture of the finish coat.

Scratch Coat on Masonry Walls—Mortar shall be trow-
eled on to a thickness of approximately $\frac{1}{2}$ in., heavily cross
scratched and allowed to become thoroughly dry before the
browning coat is applied.

(From this point on use specification covering "Application
of Stucco Coats on Frame Construction.")

Freezing—Stucco shall not be applied when the tempera-
ture is below 32° F., unless protected with canvas and heat
sufficient to prevent freezing for a period of at least 48 hours
after application.

Curing—Each coat shall be protected from drying rapidly
from effects of intense sunlight or wind until it has sufficiently
hardened to permit sprinkling. Each coat shall be kept moist
by sprinkling for at least three days following its application.

Color Decoration on Concrete

Concrete surfaces are eminently suited for express-
ing directly, motifs in any color combinations known to
the artist. Oil stains give a wide range of color without
affecting the characteristic texture of the concrete.
Craftsmen have found that the roughness and board
markings serve to enhance the decorative effect. Such
concrete surfaces possess a tone and atmosphere both
unique and pleasing.

Color decoration applied directly to the concrete
surface is extensively used on ceilings and is a natural
development for the beam and girder type of construc-
tion. Many examples have shown that once applied the
design may be protected by suitable coatings over a
long period of years, lending a desirable permanency so
difficult to attain with other media.

Many wall surfaces of concrete have also been
treated in this manner. Color decoration on monolithic
walls combined with modeling in low relief, offers possi-
bilities in wall embellishment expressive of the material.

This type of decoration is well within the usual economic
limits since it eliminates certain operations that add to
the cost of other forms of ornamentation.

Specifications for Painting Concrete

Cleaning—All loose particles and dirt shall be removed.
Grease or oil shall be wiped off with a rag saturated with gaso-
line or benzine. Surfaces previously coated shall be either sand-
blasted, or wire brushed.

Neutralization of Surface—The cleaned surface shall be
brushed with a water solution containing 4 lb. of zinc sulphate
to the gallon. At least 48 hours shall be allowed for the zinc
sulphate to react and dry.

Staining—Staining shall be done by using any good linseed
oil paint thinned to the proper consistency with turpentine.
Stains only differ from paints by containing enough volatile
solvent to make up about one-half by volume of the vehicle.

Painting—For one-coat work the paint shall be applied
without thinning. For two-coat work the first coat shall be
thinned with the proper solvent (turpentine or naphtha, 1 pt.
to the gallon). The second coat shall be applied without thin-
ning. At least 48 hours drying time shall be allowed between
coats.

Concrete Cast Stone

Concrete cast stone is being widely employed as
both an exterior and interior facing material in the finest
types of buildings where a beautiful finish is desired
which will endure. Economy, beauty, complete range
of color and texture and assured uniformity of quality
are among the advantages which account for the increas-

ing popularity of this product. Its flexibility as a medium
for architectural expression gives it unlimited scope for
originality in design.

Many of the most noted stadia, office buildings,
hotels, municipal buildings, theaters, churches, schools,
banks, etc. are built of cast stone.

ATLAS PORTLAND CEMENT.
ATLAS-WHITE PORTLAND CEMENT.
ATLAS LUMNITE CEMENT.

Quality

Atlas Portland Cement—Over a period of more than thirty years, Atlas Portland Cement has merited the distinction of being "the Standard by which all other makes are measured."

It is guaranteed to pass the Standard Specifications for portland cement which have been adopted by:

The United States Government
The American Engineering Standards Committee
The American Society for Testing Materials
The American Society of Civil Engineers
The American Institute of Architects
The American Railway Engineering Association

"Atlas-White Portland Cement"—Atlas-White Portland Cement (white) has been manufactured for 15 years and is identical in strength and durability with Atlas Portland Cement (gray).

Atlas-White Portland Cement is guaranteed to pass the Standard Specifications for portland cement as noted above.

Atlas Lumnite Cement

Gives full strength 28-day concrete within 24 hours.

A slow setting, quick hardening hydraulic alumina cement for concrete and mortar.

Permits pouring concrete one day, putting it in use with safety the next day.

For any concrete work where speed is desirable or necessary.

Packages

Atlas Portland Cement is packed in duck or paper bags of 94 lbs. net weight, 4 bags to the barrel. For export, it is shipped in especially constructed and lined barrels of 400 lbs. gross or 376 lbs. net weight.

Atlas-White Portland Cement is packed in paper and duck bags, and for export, in barrels. Same weights as above.

TRADE-MARKS

Technical and Research Department

A technical and research department is at the disposal of architects for assistance in any problems pertaining to concrete or stucco. This service is, of course, offered without obligation to them and it is hoped that architects will freely avail themselves of this department.

Uses of Atlas-White Portland Cement

- (1) Wherever a pure color or white is desired.
- (2) For non-staining mortar.

Specific Uses—

Stucco—Makes possible a wide range of color effects. As Atlas-White is neutral in color toward pigments, it gives clear and unclouded shades. Also produces excellent results when used in connection with exposed aggregates, or when mixed with naturally colored sands.

Brick Joints—Makes possible a pure white or correctly colored joint. Can be colored by mixing directly with a colored sand or by pigments.

Cast Stone, Trim and Garden Furniture—Gives white or colored effects as desired.

Terrazzo—White cement when used for this purpose doubles the number of color combinations. It will not discolor.

Swimming Pools—Used with white sand and applied as a plaster or throughout the concrete gives an inexpensive, durable and attractive finish. Particularly adapted to outdoor pools.

Interior Plastering—Interior plastering of white cement mortar makes possible interesting color and textural effects. As it is unaffected by moisture, it is also used for dairies, cold storage rooms and lavatories.

For Its Non-staining Qualities—

Pointing, Setting and Backing Fine Stone—Widely used for setting Indiana limestone and marble. Gives the strongest possible mortar and is absolutely non-staining.

Setting Tile—Will not stain the tile and is unaffected by moisture.

Stucco Finishes

The illustrations show only four of the endless variety of stucco finishes which are possible with the use of a portland cement stucco using Atlas-White.

The endless number of textures possible are produced by various methods of manipulation of the plastic material. While it is difficult to describe in detail the exact method by which they are obtained, an examination by the architect of the photographs in "Stucco—Interior Plastering—Grafitto," the book referred to above, will make the manner of finishing evident.

Stucco finishes in portland cement are unlimited as to texture and color. To secure permanently successful results in color and durability, Atlas-White Portland Cement is the ideal material.

Stucco Finish Used on House at Forest Hills, L. I.

The house, portion of which is shown, was designed by W. L. Bottomley, New York City. The finish is from an actual wall and shows a rather dry mix applied with irregular pressure and motion of the trowel

Stucco Finish Used on House at Pelham, N. Y.

This house, for which Bloodgood Tuttle of New York was the architect, is particularly pleasing in its use of stucco. The panel shows a finish placed with a sweep of the trowel, using more pressure on one end than the other

Stucco Finish Used on House at Jamestown, N. Y.

A. J. Bodker of New York was the architect for this residence. The finish was obtained by throwing on a spatter dash and smoothing the high parts with a steel trowel

Stucco Finish Used on House at Riverdale, N. Y.

The adaptability of stucco to harmonize with architectural design is evident in this house for which Julius Gregory was the architect. The panel shows a finish obtained with a rather dry mix applied with an irregular motion of the trowel

Product

DRAGON PORTLAND CEMENT.
 DRAGON SUPER CEMENT.
 MAINROCK LIME.

Production

Dragon Portland Cement has been produced in the heart of the Lehigh Valley at Siegfried, Pa., continuously since 1889. This mill has a capacity of eleven million bags per year. Large reserve stocks are maintained at the mill. Exceptional shipping facilities permit despatching 200 carloads per day.

A new mill at Thomaston, Maine, New England's own and only cement mill, to be in operation early in 1928, will produce an additional annual supply of four million bags of Dragon Cement.

Quality

The LAWRENCE CEMENT COMPANY has been engaged in manufacturing or selling cement continuously for nearly a century, having established business in 1832.

Dragon Portland Cement has been on the market for thirty-eight years. During this period the demand has steadily increased.

The quality of Dragon Cement has been carefully guarded at all times, the test requirements at the mill being considerably above the standard specifications and tests for Portland Cement adopted by the American Society for Testing Materials.

The seven-day sand tensile strength tests of Dragon Cement for the last ten years have exceeded 300 lbs. per sq. in., although the A.S.T.M. standard, until recently, required only 200 lbs. per sq. in.

Many architects, engineers, contractors and builders

TRADE-MARK
(Registered)

regularly specify Dragon Portland Cement on their work in the East because this cement attains high early strength, is remarkably uniform and exceptionally finely ground.

Dragon Super Cement

Dragon Super Cement with nothing but the usual aggregates and usual mixing methods produces concrete that is absolutely waterproof, oilproof and highly resistant to the attack of frost, seawater, acids, alkalis and other destructive agents.

Super cement has been highly endorsed by prominent architects, engineers and contractors who have used it on such work as foundations, dams, subways, tunnels, tanks, reservoirs, swimming pools, piles, pipe, stucco, etc.

Service

The LAWRENCE CEMENT COMPANY is always glad to assist architects, engineers and contractors in the solution of any problems that may arise in connection with the use of cement. Inspection of the Company's mills is cordially invited and will be arranged at any time to suit the convenience of the visitor.

MEDUSA PORTLAND CEMENTS.

For Medusa Waterproofing see page A78; for Medusa Cement Paints, see page B1689.

Output

Annual production, 3,000,000 bbls.

Quality

Medusa Portland Cements are guaranteed to pass all standard and U. S. Government specifications. Every carload is tested before being shipped. A record of laboratory tests furnished on request.

Literature

New Medusa literature, in standard size 8½x11 in., describing many of the uses for Medusa White Cement will be gladly sent at your request.

The Use and Some of the Many Applications of Medusa White Portland Cement—Waterproofed or Plain

Irrespective of type or kind of structure, Medusa White Portland Cement will fit in perfectly at several points in the construction. Any concrete work when the element of appearance is as vital and important as the permanence of the material itself, should be done in either Waterproofed or Plain Medusa White Portland Cement.

One handles and mixes Medusa White Portland Cement exactly the same as ordinary gray cement. Special attention must be given to the sand and aggregates used in the producing of different tints or shades. Various mineral oxides can be used with Medusa White Portland Cement to produce color effects.

Due to the whiteness of Medusa White Cement, it is especially desirable where light shades of color are required.

There is no waterproofed white cement except Medusa Waterproofed White Cement. We are the exclusive manufacturers of this product.

The illustrations show some of the practical, unique and enduring effects that can be secured in exterior work, and the specifications show definitely how any given effects may be produced.

Partial List of Leading Applications for Medusa White Portland Cement—

Cast stone (plain or ornamental)	Lawn furniture
Cut cast stone (plain or ornamental)	Lamp standards
Cement brick	Monuments
Cement floor tile	Mortar
Cement mantels	Ornamental cement work
Concrete block facing	Shower baths
Concrete blocks	Stucco
Concrete burial vaults	Swimming pools
Concrete fence posts	Table tops and counters
Concrete roofing tile	Terrazzo tile
Concrete stove silos	Traffic markers
Hollow concrete tile	

Description of Medusa Portland Cements

Medusa Portland Cements attain high strength rapidly; they are absolutely uniform, unsurpassed in fineness and strength.

Medusa White Portland Cement—Is perfectly white and non-staining; a product of unlimited artistic possibilities. It differs from ordinary gray cement in color and fineness only. Where ordinary portland cement is a varying shade of gray, Medusa White Cement is a uniformly clean white. This is true in the finished work as well as in the sack. It passes all the requirements of the American Society for Testing Materials. Fur-

nished either plain or waterproofed.

Medusa Gray Portland Cement—

Is uniform in color and passes all the requirements of the American Society for Testing Materials. Furnished either plain or waterproofed.

Medusa Waterproofed Cements are our regular gray and white brands, waterproofed with our celebrated Medusa Waterproofing (see our pages in Waterproofing Section), and ready for use.

A Remarkable Illustration of the Possibilities in Architectural Embellishment of Precast Work Using Medusa White Cement, on the Estate of John Bindley, Coconut Grove, Fla.

KIEHNEL & ELLIOTT of Pittsburgh and Miami, Architects
All ornamentation shown was done under the able execution of JOHN B. ORR of Miami

Vital Points to be Observed Carefully in Concrete Work

Use the proper proportions for the work intended.

Cement—The most important materials used in concrete work are cement and water.

The cement used in mass concrete or the facing of concrete work should be either Medusa White Portland Cement or Medusa Waterproofed White Portland Cement.

The gray portland cement should be either Medusa Gray Portland Cement or Medusa Waterproofed Gray Portland Cement. (In locations where it is impossible to obtain Medusa Waterproofed Gray Cement any standard gray portland cement passing the requirements of the U. S. Government may be used with the addition of the proper amount of Medusa Waterproofing.) See our pages in *Waterproofing Section*.

Storage of Cement—All cement should be stored in a weathertight, dry building to prevent caking.

Water—Water for concrete or cement work must be clean, free from oil, acid, strong alkali or vegetable matter and should be good enough to drink. Do not use an excess of water in mixing, as it will ruin the work by causing sand and stone pockets and wash away the cement, reducing the strength of concrete and causing cement work to dust and disintegrate.

Best results are obtained by making the mixture of a plastic or jellylike consistency, so as to flow readily into the forms with slight spading.

If applying cement plaster to a base which is in the least porous—such as tile, brick, old concrete walls, floors, etc.—the base must be thoroughly soaked with water before applying. Otherwise water will be drawn out of the fresh cement plaster before it has a chance to set properly and the results will be a failure.

Fine Aggregates—Sand that looks and feels good in the palm of the hand should not be accepted without further tests for quality, grading and voids.

Quality—There are numerous sands that are not wholly decomposed and will crush under pressure of the fingers. Under microscopic examination such sands will show a small crystal surrounded by a soft honeycombed wall; when used in concrete, it would break down the cementation value of the cement and result in weak, mealy concrete. Fine silica sands are often found to be matted together and should be broken up before using.

Grading—All sands should be frequently tested by thoroughly drying and running through at least three screens— $\frac{1}{8}$ in., 24 and 40.

Sand should be clean, free from clay, loam or vegetable matter. It should be graded so that all will pass a $\frac{1}{8}$ -in. mesh, one-third remaining on a No. 24 screen, one-third on a No. 40, and one-third on a No. 60. (It is rare to find a sand with such an exact grading—the above figures are given as a standard. The closer they are approached the better the final results.) The following actual sieve tests are examples of ideal sands for use in any concrete work:

3% through $\frac{1}{8}$ -in. mesh,	held on $\frac{1}{8}$ -in. mesh
20% through $\frac{1}{8}$ -in. mesh,	held on $\frac{1}{8}$ -in. mesh
35%—12% through $\frac{1}{8}$ -in. mesh,	held on No. 24 mesh
17% through No. 24	mesh, held on No. 30 mesh
35%—18% through No. 30	mesh, held on No. 40 mesh
22% through No. 40	mesh, held on No. 60 mesh
5% through No. 60	mesh, held on No. 80 mesh
2% through No. 80	mesh, held on No. 100 mesh
30%—1% through No. 100	mesh

Damp sands are misleading; the coarse will attract the minute particles, appearing apparently perfect, when in reality they are excessive in fines and dangerous.

Coarse Aggregates—Equal care is necessary in the use of the larger aggregates. Bank run should never be used before ascertaining the percentage of coarse and fine material and proportioning accordingly.

Gravel and pebbles will produce more dense concrete; trap rock and silica sand the greatest strength.

Trap rock, gravel and silica sand produce strength and density. Crushed granite or hard trap rock requires more sand.

For soft trap rock, presenting rounded corners, use less sand. It is dangerous to use the crusher run of any aggregate before screening. Dust in excess of 15% through a 60-mesh screen should never be used.

Colorimetric Test—A simple, practical test to determine

the presence of rotten vegetable or organic matter in sand, pebbles or broken stone, is made as follows:

Take a 12-oz. bottle. Fill to $4\frac{1}{2}$ -oz. mark with material to be tested. Then pour in a 3% solution of caustic soda until the volume of sand and solution after shaking amounts to 7 oz. Thoroughly shake the bottle and contents and allow to stand for 24 hours. If, at the end of this time, the liquid above the material is colorless, or only a light yellow, it is sufficiently free of organic matter to be used, provided its other qualities are suitable.

If the liquid is darker than a light yellow, approaching a brownish yellow, the material may be used for unimportant concrete work. It should not be used in first class concrete work. If the liquid is a dark brown the material should be washed or rejected.

Cause of Cracking, Hair Cracks, or Map Checks

The appearance of hair cracks or crazing in concrete or cement work results from greater shrinkage in the rich, wet surface than in the body of the work and can be prevented by keeping the work covered, moist and protected from the sun and wind, for a period from one to four weeks, according to weather and character of the work.

Hair cracks or crazing generally may be traced to any or all of the following conditions:

- (1) Mixture too rich in cement.
- (2) Too much water used in mixing.
- (3) Too rapid drying out.
- (4) Too fine sand or aggregate.

Mixture Too Rich in Cement—Neat cement when set and hardened in air contracts much more than when mixed with sand or other inert aggregate, this contraction increasing with age up to a certain period. When allowed to harden and set under water, contraction is very much less than in air, but is still present to a slight extent. With a fair proportion of sand, finely crushed stone or other suitable aggregate, the contraction is reduced to practically zero and there is no tendency for cracks to form, provided surface is protected and kept moist. As a rule, the ratio of cement to inert material should not be greater than 1 to 2.

Too Much Water Used in Mixing—When the right quantity of water is used in mixing concrete, a soft plastic mass is formed with just sufficient water to bind the cement, sand, etc., together and to remain in the mass itself with no tendency to escape or flow away.

Water also serves as a vehicle to carry the cement and finer particles of sand into the spaces between the larger pieces of gravel, stone, etc., and to distribute the component parts uniformly throughout the mass.

An excess of water will run off or rise to the surface of the concrete, carrying with it much of the cement in suspension and rob the interior of its cementing material. As the surface water evaporates, the fine cement is deposited as a layer of practically neat cement which, as stated above, has a greater tendency to contract than the poorer mixture beneath. This is the most fruitful cause of hair cracks.

Too Rapid Drying Out—Where ample precautions are taken to protect fresh concrete or cement work from drying out, by means of thick layers of wet sand, or wet cloths hung over vertical faces, and this protection is kept up for a week or more, very few if any hair cracks occur.

Neat cement or very rich mixtures which will craze when hardened in the air will show no such effect if kept under water. Therefore there is less chance for contraction when the concrete or cement is not allowed to dry out; and the prevention of contraction prevents also the tendency to crack or check on the surface.

Too Fine Sand or Aggregate—Insufficient coarse material in concrete, stucco, etc., to hold the cement and fine sand, will increase the danger of the sand and cement being washed to the surface. The same result will be obtained as where an excess of water is used.

Few contractors and users of cement realize the importance of a properly graded mixture and the practical necessity of having sufficient coarse particles, whether pebbles or fragments of crushed rock, present for the greatest strength and best results.

One of the most successful manufacturers of cast stone in Ohio attributes his freedom from hair crack trouble to care in selecting and grading his aggregates.

With attention to the above four points, we are confident that any careful user of cement can reduce hair crack and crazing trouble to a minimum, or prevent it altogether.

Specifications for Waterproofed Portland Cement Stucco

Materials—Cement—The cement for the first coat (base or scratch coat) shall be standard gray portland cement conforming to the Specifications of the American Society for Testing Materials, with the addition of Medusa Waterproofing Powder or Paste, to the amount of 2% by weight of the cement used (2 lbs. to the sack of cement).

The cement for the second or brown coat, and the third or finish coat, shall be Medusa Waterproofed White Portland Cement.

Fine Aggregate—Fine aggregate shall consist of sand, screenings from crushed stone, or crushed pebbles, evenly graded from fine to coarse, passing when dry a No. 8 screen. Fine aggregates should preferably be of silicious materials, clean, coarse and free from loam, vegetable or other deleterious matter.

Hydrated Lime—Hydrated lime shall meet the requirements of the standard specifications for hydrated lime of the American Society for Testing Materials, being used to add plasticity to the mixture.

Coloring Matter—Only permanent, mineral oxides and limeproof colors shall be used. Finish coat containing colors shall be applied as dry as possible to prevent separation of the colors. (The use of Medusa Waterproofed Cement will prevent the gradual washing out of a color surface).

Water—Water shall be clean, free from oil, acid, strong alkali or vegetable matter.

Preparation of Mortar—Mixing—The ingredients of the mortar shall be mixed until thoroughly distributed and the mass is uniform in color and homogeneous. The quantity of water necessary for the desired consistency should be determined by trial, and thereafter measured in proper proportion. The water shall be added slowly to the dry mix so as to allow the aggregates to absorb as much as possible in the course of mixing.

Machine Mixing—The mortar shall preferably be mixed in a suitable mortar-mixing machine of the rotating drum type. The period of machine mixing shall be not less than 5 minutes after all the ingredients are introduced into the mixer.

Hand Mixing—The mixing shall be done in a watertight mortar box, and the ingredients shall be mixed dry until the mass is uniform in color and homogeneous. The proper amount of water shall then be added and the mixing continued until the consistency is uniform.

Measuring Proportions—Methods of measurement of the proportions of water shall be used which will secure separate uniform measurements at all times. All proportions stated shall be by volume. A bag of cement (94 lbs. net) may be assumed to contain 1 cu. ft.; 40 lbs. may be assumed as the weight of 1

cu. ft. of hydrated lime. Hydrated lime shall be measured dry, and shall *not* be measured nor added to the mortar in the form of putty.

Retempering—Mortar which has begun to stiffen or take its initial set shall not be used.

Consistency—Only sufficient water shall be used to produce a good workable consistency. The less water in the mix, the better the quality of the mortar, within working limits.

Mortar Coats—Mortar—All coats shall contain not less than 3 cu. ft. of fine aggregate to 1 sack of portland cement.

Application—The plastering shall be applied with a steel trowel and carried on continually in one general direction without allowing the plaster to dry at the edge. If it is impossible to work the full width of the wall at one time, the joining shall be at some natural division of the surface, such as a window or door. The first coat shall thoroughly cover the base on which it is applied and shall be troweled enough to insure the best obtainable bond. Before the coat has set it shall be heavily cross-scratched with a saw-toothed metal paddle or other suitable device to provide a strong mechanical key.

The first coat shall be thoroughly wet down before the second coat is applied. The second coat shall be applied, whenever possible, on the day following the application of the scratch coat, and shall be brought to a true and even surface by screeding at intervals not exceeding 5' 0", and by constant use of a straight-edge. When the second coat has stiffened sufficiently, it shall be floated with a wood float and lightly and evenly cross-scratched to form a good mechanical bond for the finish coat. The day following the application of the second coat, and for not less than 3 days thereafter, the stucco must be thoroughly sprayed at frequent intervals and kept from drying out. The finish coat shall be applied not less than a week after the application of the second coat. Methods of application will hereinafter be described under "Finish."

Drying Out—The finish coat must not be permitted to dry out rapidly and adequate precaution must be taken to make this certain by sprinkling frequently after the mortar is set hard enough to permit it, or by hanging wet burlap or similar material over the surface, during hot weather.

Freezing—Stucco should not be applied when the temperature is below 32° Fahr., nor under any conditions such that ice or frost may form on the surface of the wall.

Stains—Dirt may be readily washed off Medusa Waterproofed White Portland Cement stucco by using a brush and Sapolio, or other cleaning compound.

Mortar Colors—Should not be used to color portland cement stucco, use only mineral oxides.

Use of Medusa White Waterproofed Portland Cement for Non-staining Mortar

Setting and backing up marble and stone work, and laying face brickwork requires a mortar that will not discolor the face of the marble, stone or face brick.

Medusa Stainless White Cement contains only a

trace of iron. Due to this purity of composition it will not streak or stain the finest of building materials. It is used extensively from coast to coast, on the finest of buildings for this purpose.

Specifications

Mortar for Marble or Stone Work

For setting, backing and pointing marble and stone work.

Non-staining Waterproofed Cement—Cement shall be Medusa Waterproofed White (Non-staining) Portland Cement, manufactured by THE SANDUSKY CEMENT COMPANY, Cleveland; or other approved white (non-staining) portland cement conforming with the requirements of the American Society for Testing Materials, and guaranteed by the manufacturer to contain 20% or more of water-repellents, ground in with the cement during process of manufacture at the mill.

Waterproofing mixed with a non-staining cement by hand or machine, at the job or elsewhere, will not be permitted to be used.

Sand—Sand shall be clean river, lake or bank sand, light in color and evenly graded from fine to coarse, all passing through a $\frac{1}{8}$ "-mesh sieve, with voids not in excess of 35% by water after thoroughly drying.

Crushed Marble for Pointing—Crushed white marble for pointing mortar shall be equal to Conlin Marble Company's, Tuckahoe, N. Y., size 20 to 30.

Measuring—Assuming that 1 bag of portland cement measures 1 cu. ft., other aggregates are to be measured accordingly by the use of a bottomless box that holds 1 cu. ft. *The measuring of sand or other material with a shovel will not be permitted.*

Water—Water in all cases shall be added slowly and only sufficient water used to reach a stiff, workable consistency.

Setting Mortar—Mortar for the setting and backing of marble and stone work shall consist of:

- 1 part Medusa Waterproofed White Portland Cement.
- $\frac{1}{2}$ part hydrated lime, by volume.
- 3 parts sand.

Pointing Mortar—Mortar for pointing of marble shall consist of:

- 1 part Medusa Waterproofed White Portland Cement.
- $\frac{1}{2}$ part hydrated lime, by volume.
- $2\frac{1}{2}$ parts white crushed marble.

Setting of Marble or Stone—All marble or stone work shall be sufficiently embedded and backplastered in the mortar to form one continuous coating. Special attention must be given to all belt courses, copings and other exposed surfaces.

Mortar for Laying Face Brick

Note: The object of using Medusa Waterproofed Cement is to overcome discoloration, dampness and efflorescence.

Non-staining Waterproofed Cement—Cement shall be Medusa Waterproofed White (Non-staining) Portland Cement, manufactured by THE SANDUSKY CEMENT COMPANY, Cleveland; or other approved white (non-staining) portland cement conforming with the requirements of the American Society for Testing Materials, and guaranteed by the manufacturers to contain 20% or more of water-repellents, ground in with the cement during process of manufacture at the mill.

Waterproofing mixed with a non-staining cement by hand or machine at the job or elsewhere, will not be permitted to be used.

Sand—Sand shall be clean river, lake or bank sand, light in color and evenly graded from fine to coarse, all passing through a $\frac{1}{8}$ "-mesh sieve, with voids not in excess of 35% by water after thoroughly drying.

Water—Water in all cases shall be added slowly and only sufficient water used to reach a stiff, workable consistency.

Measuring—Assuming that 1 bag of portland cement contains 1 cu. ft., other aggregates are to be measured accordingly by the use of a bottomless box that holds 1 cu. ft. *The measuring*

ing of sand or other material with a shovel or other implement that has no positive dimensions will not be allowed.

Setting Mortar—Mortar for laying face brick shall consist of:

- 1 part Medusa Waterproofed White Portland Cement.
- $\frac{1}{2}$ part hydrated lime, by volume.
- 3 parts sand.

Joints—Should a joint exceeding $\frac{5}{8}$ " be desired, the necessary amount of coarse grit may be added to the above mortar.

Mixing—When mortar is hand mixed, dampen the sand to a damp earth consistency, add Medusa Waterproofed Cement and hydrated lime, and mix as usual. When sand, Medusa Waterproofed Cement and lime are uniformly mixed add only enough water to secure proper consistency.

When a batch mortar mixing machine is used, dampen the sand and put into the mixer with the Medusa Waterproofed Cement and hydrated lime; allow mixer to run until cement, sand and lime are uniformly mixed. Then add only enough water to secure proper consistency.

Mortar for Laying Exterior Common Brick Walls

Notes: The object of using Medusa Waterproofing Powder or Paste is to prevent efflorescence, dampness and discoloration of the face brick or the exterior face of the brick wall.

See our pages in Waterproofing Section describing Medusa Waterproofing, Powder and Paste.

Cement—All cement shall be an approved brand of portland cement conforming with the requirements of the American Society for Testing Materials.

Sand—All sand shall be clean bank sand, light in color and evenly graded from fine to coarse, all passing through a $\frac{1}{8}$ "-mesh sieve, with voids not in excess of 35% by water after thoroughly drying.

Waterproofing Powder (or Paste)—All waterproofing shall be Medusa Waterproofing Powder (or Paste) mixed according to the directions of the manufacturers or their representatives.

Water—Water in all cases must be added slowly and only sufficient water used to reach a stiff, workable consistency.

Note: If Medusa Waterproofing Paste is to be used the above Water clause should be omitted.

Measuring—Assuming that 1 bag of cement contains 1 cu. ft., other aggregates are to be measured accordingly by the use of a bottomless box that holds 1 cu. ft. *The measuring of sand or other material with a shovel or other implement that has no positive dimensions will not be allowed.*

Setting Mortar—Mortar for laying exterior brick walls shall consist of:

- 1 part approved portland cement.
- $\frac{1}{2}$ part hydrated lime, by volume.
- 3 parts sand.

(A) Medusa Waterproofing Powder shall be used in quantity equal to 2% by weight of the cement (8 lbs. to the barrel) thoroughly mixed with the dry cement, then in turn with the sand. All according to the directions of the manufacturers or their representatives.

Note: If Medusa Waterproofing Paste is used instead of powder, the following clause (B) should be used in place of clause (A).

(B) Medusa Waterproofing Paste shall be used as follows: 1 gal. (8 lbs.) of Medusa Paste shall be added to 20 gals. of water. This is sufficient to gauge 1 barrel of cement. All according to the directions of the manufacturers or their representatives.

Note: If Medusa Waterproofing Paste is to be used the above Water clause should be omitted.

Architectural Stone Made with Medusa Stainless

No better grade of cement can be employed as the principal ingredient in manufacturing artificial architectural stone, such as cut cast stone and cast stone both plain, moulded and ornamental, than Medusa Stainless White Portland Cement (Plain or Waterproofed) especially due to its whiteness, which is permanent; its stain-

White Portland Cement (Plain or Waterproofed)

less qualities; and when Medusa Waterproofed White Portland Cement is used, the manufactured product becomes impervious to water and moisture.

Special attention must be given to the aggregates used to produce different results. This information we will gladly furnish at your request.

Structolite Cement for Fireproof Walls and Slab Construction, Sleeper Fill and Fireproofing Structural Steel

Structolite Concrete is a mixture of "Structolite" with a coarse aggregate of steam coal cinders, blast furnace slag, crushed limestone, or gravel and sand. Using the standard proportions recommended, when cured, Structolite Concrete has an ultimate compressive strength as shown in the table in column two with a weight of about half that of portland cement concrete.

Recent developments in light steel floor joists permit their use in combination with Structolite Concrete on expanded lath or Sheetrock. The economy of Structolite Cement for this

STRUCTOLITE

Reg. U. S. Pat. Off.

The Quick-Set Insulating Cement

For exterior walls, interior partitions, floors and roofs, sleeper fill and fireproofing structural steel

purpose is a strong argument for its use. Its light weight saves steel; its quick set speeds construction. At working temperatures it will set before it freezes, thus reducing the cost of winter work.

Because of its high sound insulation, fireproofness and general adaptability, Structolite is ideal for light occupancy buildings, such as apartments, office buildings, garages, hotels, hospitals, school buildings and residences.

Compression Test—The structural value of this material has been determined by compression tests made at Columbia University, New York City; The Building Department, Philadelphia, Pa.; Washington University, St. Louis, Mo., and at our own mills, using various mixtures of different aggregates.

A comparison of the loads and results of all tests show a safety factor under ordinary residence construction of not less than 10, and under average conditions from 15 to 25.

This exceptional combination of high compressive strength and light weight makes it most desirable for use in exterior bearing walls, floor and interior partitions of homes, service stations, garages and similar buildings where the loads encountered are light.

Structolite Concrete is adaptable for curtain walls of factories where loads are carried principally by structural steel.

Specifications for Structolite Concrete Floors and Roofs

Scope of Work—All floor and roof slabs over metal joists shall be the UNITED STATES GYPSUM COMPANY'S Reinforced Structolite construction. All slabs shall be of the thickness shown on the plans, and shall be laid level and true, and left in the proper condition required for the type of floor finish to be used.

Proportions—All Structolite Concrete used structurally in this work shall be of the following proportions, which shall be volumetric:

For the equivalent to a 1:2:4 portland cement concrete:
1½ parts of Structolite 1 part of sand
3 parts of coarse aggregate

Structolite Cement—The Structolite Cement used shall be as manufactured by the UNITED STATES GYPSUM COMPANY and shall be delivered to the job in the original packages.

Storage—The Structolite Cement shall be stored in a dry place and shall be well protected from the elements.

Sand—The sand shall be clean, sharp and well graded. It shall be free from loam or other organic material.

Coarse Aggregate—Coarse aggregate shall be cinders, crushed stone, gravel or slag. Cinders shall be a good grade of powerhouse cinders, containing no large unbroken lumps, and

A Structolite Floor and Roof Installation

Pouring a Structolite Floor
Can be worked over in one hour

shall be free from unburned coal. Cinders shall be screened over a $\frac{1}{4}$ -in. screen and all fines removed.

Crushed stone, gravel and slag, shall be crushed to such a size as will pass through a $\frac{3}{4}$ -in. ring and be retained on a $\frac{1}{4}$ -in. sieve. Gravel shall be clean and well graded. Gravel and slag shall be free from clay or other soft material. Slag shall be air-cooled, clean and properly graded.

Water—The water used for mixing shall be clean and free from organic substances.

Mixing and Placing—The mixing of Structolite Concrete shall be done in the ordinary concrete mixer, preferably of the tilting drum type. Care must be exercised in dumping all of each batch and keeping the mixer clean generally, so that particles of set Structolite do not remain to accelerate the next batch. The speed of the drum shall not exceed 20 r.p.m. The predetermined amount of water shall be introduced into the drum first, and the drum allowed to revolve until the paddles and sides are cleaned from any material left from the previous mix. The feeding hopper should be charged, so that the coarse aggregate is delivered into the drum first to help scour it out. For the same reason, if no hopper is used, the coarse aggregate should be placed in the drum first, after the water, and the Structolite last. Just enough water shall be used to insure a thorough mixing of the mass into a workable consistency. (The amount of water required will vary with the dampness of the aggregate.) As soon as the mass has become thoroughly mixed, it shall be removed immediately and placed in the slab. With a drum speed of 20 r.p.m., the entire mixing time shall not exceed two minutes after the Structolite and aggregate have been introduced into the drum. Dump at once; do not allow the drum to idle with all or part of the mix therein and further agitate the mass once the mixing is complete.

Slab Reinforcement—Slab reinforcement shall be an electrically welded, galvanized steel mat, having No. 10 gauge wires, 6 in. on centers in each direction, or its equivalent, placed directly on top of the metal lath.

Wood Floors—Where wood floors are indicated on the plans, they shall be laid as specified under "Carpentry".

Carpet, Linoleum, and Rubber or Cork Tile—Where these coverings are indicated on the plans they shall be applied as per manufacturer's directions. Such wearing courses require a troweled base. Whenever Structolite Slabs are to be troweled, screed the slab smooth and level, and apply a topping not less than $\frac{1}{4}$ in. thick consisting of Structolite Cement and clean, sharp sand mixed in the volumetric proportion of 1 part of Structolite to 1 part of sand. In all cases, apply the topping after the slab has set and dried out for at least 12 hours and preferably after the plastering has been done and just before the building is trimmed. Before applying the topping, clean and sweep the floor thoroughly, removing all loose particles and wet it down. Spread out a layer of Structolite and sand mixed as stated above $\frac{1}{8}$ in. in thickness and allow to remain until it has set. Then apply the balance of the topping mixed very dry at about the consistency of brick mortar, and strike off level with the screed strips. Float and trowel as required to a smooth, level surface using a procedure similar to that employed in surfacing walls. Do not trowel through the set.

Composition Finish—Where composition finish is indicated on the plans, it should be applied as per manufacturer's directions.

Tile or Marble Floor Finish—Where tile or marble finish is indicated on the plans, they shall be laid according to the specifications of the tile manufacturer.

Terrazzo Finish—Where terrazzo finish is indicated on the plans, it shall be laid according to the most recent specifications of the Portland Cement Association. The combined thickness of the finish and bed shall not be less than $1\frac{1}{2}$ in. thick on top of the Structolite concrete slab.

Cement Finish—Where Cement Finish is indicated on the plans, it shall be applied as a free standing slab, according to the latest specifications of the Portland Cement Association. In applying the cement finish, the top of the slab shall be brought to a smooth surface by spreading and screeding thereon a layer of sand. (Use just enough sand to even up the high spots in the rough slab.) Then cover the slab surface with a layer of Slater's Roofing Felt weighing approximately 32 lb. to a roll of 500 sq. ft.

The topping shall not be less than $1\frac{1}{2}$ in. thick, preferably of a 1 to 3 mix with pea gravel aggregate. It shall be reinforced with a light mesh. The slabs shall be cured with a blanket of wet sand or shavings for a period of not less than

A Beautiful "Structolite Home"

two weeks, and shall be divided into squares not exceeding 100 sq. ft. each and preferably less.

Roof Slabs—The Structolite concrete roof slabs shall be troweled smooth and level to receive the roof covering.

Home Building with Structolite

With its remarkable insulation, strength, and deadening values, combined with light weight and nailability, Structolite makes a fireproof residence wall that cannot be equalled with any other material or combination of materials at anywhere near its cost.

Consider this: *Within itself* Structolite is load bearing, insulating, adaptable and cannot be equalled on a value giving basis.

We have recently supplemented our poured "Structolite Home" construction with a precast neat Structolite Tile that is designed to combine the features of the poured house in a unit construction that can be handled without the use of special equipment. Tile construction is less costly than poured and more adaptable for winter work. No special details are required and any mason can handle.

Either poured in place or built of precast standard masonry units cemented together with Structolite mortar offer a monolithic wind tight structure that is rugged and permanent. It cannot burn.

Brief Description of Structolite Tile

Insulation—The conductivity of a finished 8 in. wall is about 0.10 B.t.u. per sq. ft. per hr. per diff. in degree Fahrenheit.

Strength—A compression load of 1000 lb. per sq. in. gross area is obtained before failure.

Weight—8x8x16 in. tile weigh about 25 lb. each. 8x6x16 in. tile weigh about 18 lb. each.

Size—Standard 8x8x16 in. and 8x6x16 in.

Structolite Tile

Products

CELITE, a Workability Agent for Concrete.
SIL-O-CEL HIGH TEMPERATURE INSULATING MATERIALS.
Also Filter-Cel and Super-Cel Aids to Filtration.

Celite

Celite is a dry powder composed of extremely fine particles of amorphous silica. Added to a concrete mixture with the other dry materials it stabilizes the mass, holding the portland cement, water, sand and coarse aggregate in the same relation to each other throughout handling and placing as when they left the mixing drum.

Improved Workability—The first benefit of Celite in a concrete mixture is improved workability. It obviates the use of excessive mixing water and makes it possible to successfully place concrete of drier consistencies in mass structures or in intricate forms, without danger of honeycombing or segregation.

What Improved Workability Means—(1) It results in quicker and cleaner discharge.

(2) The concrete can be placed with less labor and manipulation.

(3) The concrete will flow into place in the forms around intricate reinforcing, completely filling all corners and recesses.

(4) Relatively dry concrete can be satisfactorily handled by chutes without the need for excess water.

(5) In cases where central mixing is employed no segregation will be encountered in transit from the mixer to the job, and difficulties in dumping from trucks will be eliminated.

Uniformity and Strength—Segregation is the principal cause of non-uniformity in a concrete structure. It can be absolutely overcome through the correct use of Celite, so that the minimum strength (which is in fact the effective crushing strength of the concrete) is greatly increased.

A higher average strength also is made possible since concrete containing Celite can be placed with a lower slump, ordinarily, than would otherwise be used.

Water-tightness—Celite provides integral water-tightness in concrete in which it is used—a result of improved uniformity and decreased void sizes.

Concrete in Sea Water—The value of amorphous silica in combining with the free lime which is released as concrete hardens, is particularly emphasized where concrete structures may be subjected to the action of sea water. Celite, being practically pure amorphous silica, is a very effective material for preventing sea water corrosion.

Admixture Tables—The quantity of Celite which should be used to secure best results varies with the mix. Harsh aggregates may require a slight increase over the amounts specified. In any case, however, the amount of Celite constitutes only a very small proportion of the entire mixture.

AMOUNT OF CELITE RECOMMENDED

Concrete mix	Economic limits per bag of cement	Average recommendations per bag of cement
1: 1½: 3	1½-3 lb. Celite	2 lb. Celite
1: 2½: 3½	2-4 lb. Celite	2½ lb. Celite
1: 2: 4	2-4 lb. Celite	3 lb. Celite
1: 2½: 5	3-6 lb. Celite	4 lb. Celite
1: 3: 6	4-8 lb. Celite	5 lb. Celite

Increased Yield—The cost of Celite in many cases is repaid alone by the increased yield of finished concrete in place. In a 1:2:4 mix, for example, the use of 3 lb. of

Celite per bag of portland cement ordinarily results in an increase in the yield of finished concrete of approximately 5 per cent.

Method of Use—No changes of equipment or in methods of mixing or placing concrete are involved in the use of Celite. This powdered material is simply added with the other dry ingredients at the mixer. The mix is handled in the usual manner. No more water is added to a concrete mix containing Celite than is necessary to give an equal or lesser slump than would be secured with plain concrete.

Standard Specifications—Celite shall be used in all concrete in the proportions set forth below for the different concrete mixtures.

... : ... : ... concrete ... lb. per bag of cement
... : ... : ... concrete ... lb. per bag of cement.

The Celite may be measured by a pre-determined volume in such a manner as will insure the correct proportion by weight, and shall be added at the mixer with the dry materials.

Only sufficient water shall be used to give a workable consistency and in no case shall more water be added than will give a slump of ... in.

Sil-O-Cel Insulating Materials

For the insulation of all types of boilers and auxiliary heating and power plant equipment, Sil-O-Cel is provided in the form of brick, block, powder, plastic and hard finish cements and coarse aggregate (C-3) for making insulating concrete.

Building walls, partitions and roofs are ordinarily insulated and sound deadened with a filling of Sil-O-Cel Coarse Grade Powder.

Sil-O-Cel Standard Insulating Brick—Recommended for insulating service behind the refractory or over steel surfaces where direct temperatures will not exceed 1600° F.

Sil-O-Cel C-22 Insulating Brick—These brick are free from shrinkage at direct temperatures as high as 2000° F.

Sil-O-Cel Super Brick—Semi-refractory, withstand direct temperatures up to 2500° F. without shrinkage or deterioration.

Mortar for Laying Sil-O-Cel Brick—This is included with each shipment. The brick are well packed in cartons of 25 for convenience in storage and handling.

Insulating Powder and Coarse Grade Insulation—Used as an insulating filler in hollow walls and over the tops of heated equipment.

C-3 Aggregate—A coarsely ground calcined material used as an insulating filler in hollow walls or bases where temperatures behind the refractory run as high as 2000° F. Weight in place, 36 lb. per cu. ft. Four parts of C-3 mixed with one part by volume of portland cement make an insulating concrete of great durability, which weighs when dried, only 60 lb. per cu. ft.

Insulating Cements—("Plastic" and "Hard Finish"), made with Sil-O-Cel, are provided for covering irregular surfaces where insulating brick could not be conveniently used.

Insulating Blocks—made of Sil-O-Cel and long fibered asbestos, are supplied in 6 and 12-in. widths, lengths of 18 and 36 in., and thicknesses of 1, 1½, 2, 3 and 4 in.

Celite Engineering Service

Celite Engineering Service is freely available at every office of the Company to co-operate toward the solution of any problems relative to the proportioning and placing of concrete, or the insulation of buildings or heated equipment.

1:2:3½ Concrete Containing 3 lb. of Celite per Bag of Cement

ADENSITE CO., INC.

Manufacturers of Concrete Waterproofing and Hardeners

116 West Thirty-ninth Street
NEW YORK, N. Y.

PHILADELPHIA OFFICE: Land Title Building

LABORATORY: Jackson Avenue and Seventh Street, LONG ISLAND CITY, N. Y.

Products

ADENSITE, a Liquid Integral which is used in the gauging water for Hardening and Waterproofing portland cement concrete and mortar.

PUR-TONE COLORS, mineral color in powder form for portland cement floor finish.

ADAFLINT, a flush-on floor hardener in crystal form.

Adensite

Uses—Waterproofing concrete walls below grade, either in mass concrete or in plaster coat. Hardening and dustproofing cement floor finish.

Waterproofing portland cement stucco.

For brick masonry, Adensite gauged mortar is smooth working, does not drag and prevents "riding."

Authoritative Tests—Upon request, we shall be pleased to furnish the architect with authoritative test data on Adensite, compiled from testing laboratory results and research work carried out at the U. S. Bureau of Standards for the A. S. T. M.

Guarantee—Adensite is unconditionally guaranteed to produce positive and permanent results by the manufacturers, the **ADENSITE CO., INC.**

Surety maintenance bonds furnished on waterproofing jobs.

Service—Our field men visit construction operations while Adensite is in use.

Colored Floors

PurTone colors are specially prepared for use with portland cement in floor finish and are used integrally throughout the entire top finish, assuring permanent and positive results.

(Specifications upon request.)

Applied Hardener

Adaflint, dissolved in water, 2 lb. to the gallon and slushed over an old or new floor, will render a cement finish hard and dustless.

Adaflint is furnished in natural gray, oak and green.

Shipments

Adensite is shipped in 5, 30 and 50-gal. containers.

PurTone Color is shipped in 550-lb. barrels.

Adaflint is shipped in 2-lb. boxes, 25 to a case.

TRADE-MARK

Independence Hall, Philadelphia

Waterproofed with Adensite gauged plaster coat

Adensite Specifications

Waterproofing Mass Concrete—The gauging liquid for concrete shall be prepared by placing from 3 to 4 gal. of Adensite in a 52-gal. barrel and adding water. For every 1-bag batch, use between 3 and 4 gal. of the prepared liquid (amount of liquid varies with fineness of aggregate and temperature).

Joints Between Pourings—Shall be thoroughly grouted with Adensite grout.

Waterproof Plaster Coatings—Shall be $\frac{5}{8}$ in. in thickness, applied in 2 coats and properly coved and bonded to the floor.

Bonding New to Old Concrete—All surfaces before application of new work shall be thoroughly roughed, cleaned and dampened with Adensite grout to insure perfect bond.

Adensite Grout—Add 1 part Adensite to 3 parts water and enough cement to give mixture a creamy consistency.

Protection of Green Work—To protect green work against action of water, the pump shall be kept in operation 24 hours after pouring or trowelling of work.

Floor Hardening—Upon the plain concrete floor slab shall be laid a 1-in. topping of 1 part cement and 2 parts clean sand. This dry mix shall be tempered with a liquid composed of 3 gal. of water to 1 qt. of Adensite for every 1-bag batch. No dryer shall be used.

Gauging Liquid for Floor Finish—Gauging liquid may be prepared by putting 4 gal. of Adensite into a 52-gal. barrel and adding water (no stirring required).

Bond—When slab is over 48 hours old, before topping is stretched, it shall be given a coating of Adensite grout.

When slab is over 7 days old, before topping is stretched, it shall be roughed with a pick or chisel, cleaned and given a coat of Adensite grout.

Brick Masonry—The mortar shall be composed of 1 part portland cement, and 3 parts clean sand, tempered with a liquid composed of 1 part Adensite to 12 parts water.

THE AMERICAN FLURESIT COMPANY

Manufacturers of Fluresit, a Hardening, Densifying, Waterproofing and Acid-proofing Admixture for Concrete, Mortar and Cement Stucco

27 East Water Street
CINCINNATI, OHIO

FOREIGN FACTORIES

LONDON, ENGLAND
PARIS, FRANCE

HANAU, GERMANY
BARCELONA, SPAIN

CAIRO, EGYPT
VIENNA, AUSTRIA

BUDAPEST, HUNGARY
PRAGUE, CZECHO-SLOVAKIA

Product

FLURESIT, a hardener, accelerator, waterproofer, acidproofer, freezeproofer, densifier and anti-efflorescent for concrete and mortar.

Service Record

Fluresit has been used in Europe since 1912, and is highly recommended by leading architects and engineers all over the world, as proven by testimonials which will be sent on request.

Special Features

Fluresit is a chemical compound, in paste form, which is either dissolved in the gauging water or added directly to the mixer. When used according to the specifications, Fluresit immediately sets up a chemical action which continues throughout the hardening of the concrete or mortar, quickening the time of set and contributing many other desirable qualities.

FLURESIT 6 MONTHS SALT WATER COMPRESSION TEST

Two cylinders were submerged 30 ft. below the surface in the salt water of Tampa Bay, for a period of 6 months. The cylinders were 6x12 in. and consisted of 1 part cement and 3 parts standard Ottawa sand.

Cylinder No. 11 contained an admixture of Fluresit. Cylinder No. 23 was made with plain water.

Cylinder No.	Compression test	
	Total load, lb.	Unit, lb. per sq. in.
11	67,190	2376
23	51,170	1810

Cylinder No. 11 broke sudden and sharp, thus breaking aggregate. Cylinder No. 23 split and crumbled.

TRADE-MARK

As an Accelerator, Densifier and Hardener—The series of tests described are ample evidence of the value of Fluresit in concrete mixtures. The Fluresit was added to the wet mix in the proportion of 10 lb. Fluresit per cu. yd. Fluresit-concrete starts to set in 2 hours, 20 minutes, setting completely in 12 hours, 30 minutes.

TESTS MADE BY G. F. GEBHARDT AT THE ARMOUR INSTITUTE OF TECHNOLOGY, CHICAGO, ILL.

As a Waterproof—Fluresit will withstand water seepage under a pressure of 20 atmospheres (3000 lb. per sq. ft.). It insures dry, healthful basements and improves stucco by not only making it harder, but by also making it rainproof. Fluresit makes concrete permanent even under the action of salt water and in addition deters the formation of barnacle growth.

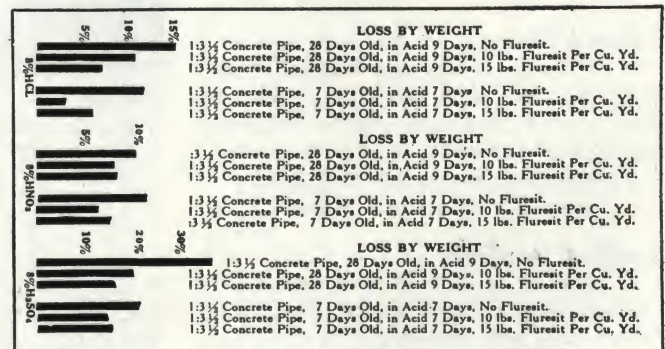

As an Acidproofer—Tests were conducted on concrete sewer pipes, immersed in 8% solutions of hydrochloric, nitric and sulphuric acids. The concrete pipes were made in the plants of the Mid-West Concrete Pipe Co., Chicago, Ill. The mix consisted of 1 part cement to 3½ parts sand and small gravel. The pipes were 12 in. in diameter. Cured in steam. Tested at 7 and 28 days.

Note: While it is not probable that 8% acid solutions will ever be encountered in actual practice, the tests clearly indicate that Fluresit concrete when subjected to mild acid action for a long period of time can be depended upon to have a life 20 to 50% longer than non-Fluresit concrete used under the same conditions.

As a Freezeproofer—Fluresit foundations were poured at zero and at 5° above zero, Fahrenheit, without freezing.

As an Anti-efflorescent—The action of soil acids and alkalis are completely counteracted by Fluresit. Calcium combines chemically with Fluresit to form a permanently insoluble compound, so that it does not cause the unsightly surface crystallization known as salt-peter rash or efflorescence on brick or masonry work.

Heat Resistant—Fluresit-treated concrete will withstand a temperature of 2700° F. without breakdown.

Directions for Use

Use 10 lb. of Fluresit per cu. yd. of concrete for waterproofing and 12 lb. Fluresit per cu. yd. for mortar and acidproofing. Thoroughly mix a given weight of Fluresit with an equal weight of water. This will produce a thick, creamy paste and 1 qt. of this paste will weigh approximately 2 lb., containing 1 lb. Fluresit and 1 lb. water. Add this paste to the concrete ingredients in the mixer on the basis of: 1 qt. for each pound of Fluresit desired in the concrete.

Note: When using Fluresit in concrete, less mixing water is required than when not using Fluresit, due to the fact that Fluresit fattens the mix appreciably.

ESTABLISHED 1895

THE ANTIHYDRINE COMPANY

308 Washington Building
NEW HAVEN, CONN.

Product

Manufacturers of ANTIHYDRINE, a Coating for Dampproofing and Stain-proofing.

Description

Antihydrine is a material made of a high grade of asphalt carefully prepared in combination with several chemicals, which combination gives it the peculiar property of *forming (without heating) a continuous glossy and impervious coating upon porous surfaces, without penetration.*

Antihydrine is the pioneer dampproof paint, having been first made in 1895. *There has been no subsequent change in formula.*

Advantageous Features

(1) Antihydrine eliminates the necessity of using lath and wood furring for interior plastering of outside walls, plastering being applied over the Antihydrine within 24 hours.

(2) Renders walls dampproof.

(3) Prevents staining of plastering on walls and on fireproof work; also, the following:

Applied to Inside of Outside Walls—(4) No furring needed—cost of and space occupied by furring are saved.

(5) Dangerous places to harbor vermin and encourage fires (when wood furring is used) are eliminated.

(6) Outside walls are made absolutely dampproof.

(7) Building is made warmer and more easily heated.

(8) All staining of and efflorescences on plastering are avoided.

Applied to Fireproof Blocks in Ceilings and Partitions—(9) All staining and efflorescence prevented.

(10) Plastering on blocks dries quickly, saving much time.

(11) All plastered surfaces permit diversified decoration without danger of damages from dampness.

(12) Discoloration of plastering from smoky brick is prevented.

Applied to Built-in Surfaces of Iron, Limestone, Marble, Face Brick, etc.—(13) All ironwork built in wall is preserved.

(14) Staining and efflorescence on exterior of limestone, marble and brick are prevented.

(15) Use of *ordinary* cement mortar in the backing is allowed, thus saving time and money otherwise spent in preparation of expensive cement mortar.

ing, however, must be kept absolutely continuous, covering every part. A second coat can be applied, if desirable, within a few hours after the first application.

Covering Capacity

Extensive, by reason of its lack of penetration. 1 gal. covers about 100 sq. ft. of brickwork or fireproofing, 1 coat; or, 60 sq. ft., 2 coats; 1 coat, properly applied, is sufficient for the prevention of dampness and stains.

Shipment

Antihydrine is delivered in casks of 10 and 50 gals.

Cost

The cost of Antihydrine is \$1.25 per gal.

Specification Data

The brush shall be the kind used for oiling brick fronts; contents of barrel to be thoroughly stirred before application; every part to be covered, leaving no small holes, etc.; coating to be thin where it is to be plastered over, with sufficient body to leave a glossy surface; and the Antihydrine to be soft or "tacky" when plastering is applied.

First coat of plastering, as thin as will allow of proper scratching, will dry quickly; second coat is applied immediately thereafter; after drying, third and last coat of plastering is applied when, after a few days, surface will be ready for painting and decorating.

Products and Services

"ANTI-HYDRO PERMANENT," a Liquid Integral Compound for waterproofing, dampproofing, accelerating, without weakening, and for hardening all portland cement mixtures.

ARMORTOP, a liquid applied Hardener and Dust Preventer for cement floor surfaces.

ACCELLO, a water solution of commercially pure calcium chloride for Refrigeration and for Accelerating the Set of Concrete in cold weather, without freezing.

CONSULTING WATERPROOFING ENGINEERS, for consultation and design for all waterproof constructions. Correspondence invited.

Guarantee

On many important installations we have furnished a written guarantee for a period of five years on the maintenance of waterproof concrete and the dustproofing and hardening of concrete floors. A Surety Bond will be furnished on all waterproofing installations supervised by our Engineering Department.

"Anti-Hydro" Concrete Integral Waterproofer and Hardener

Description—"Anti-Hydro" is a liquid compound, with an affinity for cement. When added, in certain percentage to the water used in gauging portland cement mixtures in the usual way, it has the effect, without retarding setting, of rendering cement in all kinds of masonry impervious to water, moisture, frost, gas, oils, odors, sugar solutions, alkalis and most acids.

It excites and brings into service all the cohesive or colloidal possibilities of portland cements, which in themselves are most efficient waterproofing mediums. There are no alums, hydrate of lime, greases, oils, stearic acid or decomposable ingredients used; neither are there any iron admixtures—all of which disintegrate concrete in time.

Hardens and Dustproofs Concrete Floors

"Anti-Hydro's" function may be expressed as waterproofing cement with cement; that is, filling the voids with a cement solution, which crystallizes at the same time as the cement, integrally forming a hard, insoluble silicate of greater tensile strength, density and activity. It enriches mortars so that cost of troweling, mixing and supervision is reduced to a minimum. In fact, it more than pays its cost in labor saving. It hardens wearing surfaces to a degree that makes them dustless and adamant. It lowers the freezing point of the gauging water, permitting concreting when the temperature is as low as 15° F.

When mixed with portland cement "Anti-Hydro"

Lowers Freezing Point

Dampproofs Brick Mortar and Prevents Efflorescence

proofing brick mortar and for preventing efflorescence; waterproofing, hardening and bonding concrete roads.

Approval—The superiority of "Anti-Hydro" for waterproofing and concrete hardening is demonstrated by the permanency of work completed since 1904, and by the comparative tests of the United States Bureau of Standards. Their Technologic Paper No. 3 designates "Anti-Hydro" as Compound No. 40, and states "It is the most impermeable of any of the mortars."

Specifications—Waterproofing in Mass—To the 1:2:4 mix, for gauging, add 1½ gal. of "Anti-Hydro" for every cubic yard of concrete. Proper consistency will be obtained if, for each barrel of cement, 1 gal. "Anti-Hydro" and from 10 to 15 gal. of water be used. If forms are below water level, concrete should be poured extremely stiff. Unless walls and floor are poured at one time, key all joints and bond them with "Anti-Hydro" grout. (See bonding directions below.)

Floor Hardener—The 1-in. floor topping of 1:2 mix shall be gauged by addition of "Anti-Hydro" to all water used in tempering dry mixture, in proportion of 1 gal. of "Anti-Hydro" to each barrel (4 bags) of cement. The proper consistency will be obtained if, for each barrel of cement, 1 gal. of "Anti-Hydro" and 10 to 12 gal. of water be used. (See bonding directions below.)

Waterproofing in Coatings—Floor work shall be 1 in. in thickness, and shall serve the double purpose of waterproofing agent and dustless wearing surface.

Wall coatings (2-coat) shall be ½ in. in thickness from floor level, where they shall be properly coved and bonded to floor, and carried up to at least 1 ft. above grade.

The 1:2 mortar shall be gauged by addition of "Anti-Hydro" to all water in proportion of 1 gal. "Anti-Hydro" to each barrel (4 bags) cement.

Perfect Bond—To assure perfect bond to underlying masonry, all surfaces, before application of waterproofing, shall be thoroughly roughened, cleaned, dampened and grouted.

forms a plastic mass which sets up very quickly and is used for calking metal passing through concrete, and for stopping leaks under pressure. Mixed with water and cement, it forms a dampproof paint which can be applied to the inside of masonry walls or to the back of limestone to prevent discoloration.

"Anti-Hydro" is used for hardening cement floors, waterproofing concrete in mass and in surface coating, and bonding topping to underlying slab; dampproofing and water-

A slush or grout of neat cement, using 1 part "Anti-Hydro" to 3 parts of water, is first applied. Coatings shall be applied not later than 24 hours after surfaces have been prepared and while slush coat is still wet.

Note: Specifications for waterproofing *Brickwork, Stucco on Solid Masonry and Stucco on Metal Lath and Dampproofing* furnished on request.

Acid Resisting—Write for special specifications.

Road Work—"Anti-Hydro" is especially suited for concrete pavements and roads. It makes concrete as hard in 24 hours as it would ordinarily be in 8 days and actually increases the strength of concrete 22%. Due to its quick hardening qualities, roads are made ready for use in 24 hours after they are laid by mixing 1 gal. of "Anti-Hydro" to 10 gal. of water.

"Anti-Hydro" can be used with any portland cement at a minimum cost.

For maintenance work, "Anti-Hydro" will bond new concrete securely to old.

"ANTI-HYDRO" QUANTITIES

Kind of work	Quantity anti-hydro per bbl. cement	Covering capacity
Waterproofing in mass 1:2:4 concrete	1 gal.	3½ cu. yd. concrete
Waterproofing ¾-in. plaster coat	1 gal.	100 to 125 sq. ft.
Waterproofing 1-in. floor topping	1 gal.	100 to 80 sq. ft.
Waterproofing stucco ¾ in.	1 gal.	100 sq. ft.
Waterproofing brickwork ¾-in. joint	1 gal.	700 brick or 35 cu. ft.
Dampproofing brickwork ¾-in. joint	1 gal.	1000 brick or 50 cu. ft.
Dampproofing in cement wash	1 gal.	400 sq. ft.—2 coats
Hardening cement floor 1-in. topping	1 gal.	100 to 80 sq. ft.

Armortop Concrete Applied Dustproof and Hardener

Description—Armortop is a liquid compound which, when applied to any concrete surface, old or new, changes the soft granular topping of the concrete into a granitike mass that resists the most severe wear and abrasion without dusting up. The application of Armortop insures added years of wear and use for any cement floor whether it has just been laid or whether it has been in service for several years. It saves tearing up and relaying old floors which are beginning to rut.

So easily, quickly and surely does Armortop transform soft, crumbling, dusting floors into new, hard, dustproof ones, that the whole job can be performed in the evening after closing hours by any ordinary laborer. Next morning floors are ready for use without loss of time, costly shutdowns and delays to manufacturing.

No skill is required to apply Armortop. Simply mix it with water and brush it with a stiff brush or broom over the surface to be treated.

An Ordinary Concrete Surface Can be Deeply Cut with a Nail or Pointed Instrument as Shown Above

The Same Concrete Surface Treated with Armortop Becomes so Hard That It Can Scarcely Be Scratched with the Same Nail

Armortop reacts chemically with cement and combines with it, forming a new compound which binds the loose, disintegrating particles of the concrete mix into a dense hard mass. Because of this reaction, Armortop results are permanent and should not be confused with temporary paint coatings. The covering capacity of Armortop varies with the density of the floor. One gallon will cover from 70 to 150 sq. ft. of floor surface.

A concrete test slab treated with Armortop will be sent to any one desiring to make the comparative test.

Specifications—Upon the clean, dry floor apply a solution of 1 part Armortop and 1 part water in 2 or more coats, depending upon the density of the floor. Allow 4 hours to elapse between coats.

Accello Concrete Accelerator and Anti-Freeze

Description—Accello, a liquid solution, is used to accelerate the set of cement mortars and floor finish in very cold weather, and to make possible the hydration of portland cement mixtures at temperatures as low as 14° F.

in plain concrete, cement plaster, floor toppings, brick mortar, and road work, the use of Accello during the winter months, when the temperature falls as low as 14° F., is indispensable. It insures masonry work against frost and freezing, and permits work to continue during the cold weather.

Accello makes better concrete road work possible, speeds up work and reduces delays to traffic to a minimum.

Accello makes bricklaying possible until the temperature drops below the point at which it pays to keep the men at work.

Accello is a standardized solution of calcium chloride, uniform in quality and strength. It is easy to use. Any unskilled workman can add it to the gauging water.

The proportions necessary are shown below:

Proportions of Accello and Water at Outside Air Temperatures—

- 35° F., use 1 part Accello with 20 parts water
- 32° F., use 1 part Accello with 15 parts water
- 28° F., use 1 part Accello with 12 parts water
- 25° F. (or less), use 1 part Accello with 10 parts water
- 14° F. (or less), mechanical heat is necessary

Detailed Information

Write for complete data and specifications for any work within the scope of "Anti-Hydro" products. The services of our Engineers are available at all times.

Dealers Everywhere Carry Stock

A complete stock of "Anti-Hydro" products is carried by dealers throughout the country.

Shipment

"Anti-Hydro" is shipped in standard containers of 5, 10, 20 and 30 gal.

Armortop, in containers of 5, 30 and 50 gal.

Accello, in barrels of 50 gal.

Twenty-six Years of Quality and Service—1901-1927

For the past 26 years we have specialized in the manufacture of waterproofing and dampproofing materials, floor hardeners and protective coatings of all kinds.

As pioneers in solving the most difficult waterproofing problems, Aquabar has proven to be a most economical and efficient waterproofing compound. It is used extensively in the construction of swimming pools, reservoirs, vaults, foundations, tunnels and all other kinds of masonry construction.

Detailed architects' specifications and information on any of our products will be furnished upon request, without any obligation on your part.

No. 1 Integral Compound

Description—A soft semipaste which is easily dissolved in water for waterproofing mass concrete, cement plaster, cement mortar for brick and stone work, stucco, etc. It does not affect the strength of concrete, but increases its effectiveness with age.

Specifications—**Waterproofing Mass Concrete**—A dry mixture of cement, sand and stone—1:2:4 mix, shall be tempered to a medium wet consistency with water, to which 1 part of Aquabar Integral Compound No. 1 has been added to every 50 parts of water, in strict accordance with manufacturer's directions.

Covering Capacity—From $\frac{1}{2}$ to $\frac{3}{8}$ gal. will waterproof 1 cu. yd. of mass concrete 1:2 mix.

Waterproofing Cement Mortar and Stucco—The waterproofed cement mortar, consisting of 1 part cement, 2 parts

sand with water, shall be prepared by tempering to required consistency, to which 1 part Aquabar Integral Compound No. 1 has been added to every 25 parts water, in strict accordance with manufacturer's directions.

Covering Capacity—1 gal. will waterproof approximately, 150 to 175 sq. ft. 1-in. top coat 1:2 mixture cement mortar, or, approximately, 200 to 250 sq. ft. of cement stucco 1 in. thick.

Aquatite Integral Liquid Waterproofing

Description—A liquid compound for waterproofing and accelerating mass concrete and cement mortars.

Specifications—**Waterproofing Mass Concrete**—To the 1:2:4 mixture for gauging add $1\frac{1}{2}$ gal. of Aquatite for every cubic yard of concrete. Proper consistency will be obtained if for each barrel of cement 1 gal. of Aquatite and from 10 to 15 gal. of water be used. If forms are below water level, an extremely stiff mixture should be poured.

Waterproofing Cement Mortars—The 1:2 mortar shall be gauged by addition of Aquatite to all water in the proportion of 1 gal. Aquatite to each barrel (4 bags) of cement.

Covering Capacity—Approximately $1\frac{1}{2}$ gal. will waterproof 1 cu. yd. concrete 1:2:4 mix; 1 gal. will waterproof 100 sq. ft. 1-in. top coat 1:2 mix cement mortar.

Gimbel Brothers Department Store, Philadelphia, Pa.

GRAHAM, ANDERSON, PROBST & WHITE, Architects
THOMPSON-STARRETT COMPANY, Contractors

Foundations waterproofed with Aquabar Integral Waterproofing Compound No. 1

Clear-Coat No. 2

Description—A colorless, transparent liquid for waterproofing and dampproofing outside walls (above grade) of brick, stone, concrete, cement, terra cotta, stucco, etc. Clear-Coat No. 2 does not discolor surfaces to which it is applied. Penetrates readily, filling all pores, rendering the surface impervious to moisture and driving rains.

Covering Capacity—Approximately, 125 sq. ft., 1 coat; 80 sq. ft. per gal., 2 coats, depending upon porosity.

Statite Plaster Bond No. 3

Description—A black compound for application to masonry surfaces of all kinds, so as to form a dampproofing and bond for plaster. It eliminates furring and lathing.

Covering Capacity—Approximately, 75 sq. ft. per gal., 1 coat; 50 sq. ft. per gal., 2 coats.

Marine Cement No. 3A

Description—A black compound of heavy consistency for dampproofing exterior foundation walls below grade, also for application to floor slabs of ground floors. Applied cold.

Covering Capacity—Approximately, 60 sq. ft. per gal., 1 coat; 40 sq. ft., 2 coats.

Stone Backing No. 3B

Description—A black compound for dampproofing unexposed surfaces of cut stone and for rustproofing metal surfaces. It is applied just as it comes from the container.

Covering Capacity—Approximately, 125 sq. ft. per gal., 1 coat; 75 sq. ft., 2 coats.

Mastic Insulite Cement No. 4

Description—A black mastic for waterproofing foundation walls, tunnels, etc., against heavy water pressure; for overcoating, calking and patching old roofs; sealing cracks, open joints, etc. Applied cold (with trowel) $\frac{1}{8}$ to $\frac{1}{4}$ in. thick according to the smoothness of the surface. When set, it has the consistency of hard rubber, never gets brittle and is unaffected by changes in temperature. Very elastic and adhesive; works freely.

Covering Capacity—Approximately, 25 to 30 sq. ft. per gal., 1 trowel coat.

Iron-Clad Crystals No. 7B (Surface Treatment)

Description—These crystals are dissolved in water, and applied to the concrete surface with a stiff brush or broom in 2 coats of equal strength for wearproofing, waterproofing and dustproofing of same.

Covering Capacity—Approximately, $2\frac{1}{2}$ lb. will treat 100 sq. ft. of surface with 2 coats.

Iron-Clad Liquid Floor Hardener

Description—This material is flushed on the cement floor just as it comes from the container in 3 applications, for the wear-proofing and dustproofing of same.

Covering Capacity—Approximately, 1 gal. will cover 100 sq. ft., 2 coats, depending upon porosity.

Liquid Floor Hardener (Integral Method)

Description—This liquid is added to the water used in mixing the cement top coat for wearproofing, waterproofing and dustproofing cement floors.

Covering Capacity—1 gal. will harden, approximately, 100 sq. ft. of 1-in. top coat, 1:2 mixture cement mortar.

Crysteel Metallic Hardener No. 7

Description—This is a metallic powder that is mixed with the cement used for top coating. It forms a metallic crust that will withstand the most severe traffic. Designed for factories, warehouses, etc.

Covering Capacity—Approximately, 30 lb. will treat 100 sq. ft. of surface.

Senior High School, Reading, Pa.
RICHTER & EILER, Architects A. H. LEADER, Supt. of Bldgs. M. MELODY & SON, Contractors
Foundation walls, floors, etc., waterproofed with Aquabar Aquatite Integral Liquid Waterproofing. Subject to pressure of water

Wood Floor Preservative

A translucent liquid for preserving and dustproofing maple and yellow pine floors, without changing the appearance of the surface. It prevents rotting and decay, and adds to the wood those essential elements of preserving its life and appearance.

Covering Capacity—Approximately, 250 sq. ft. per gal. for 1 coat; 350 sq. ft. per gal. for 2 coats, depending upon the porosity.

Elasticote No. 6 Waterproof Paint

Description—A highly specialized liquid cement coating for waterproofing and dampproofing exterior and interior concrete, brick, cement, stucco, plaster and masonry walls. Gives a handsome stonelike appearance and offers excellent wearing qualities. Made in various colors.

Covering Capacity—Approximately, 150 sq. ft. per gal. for 1 coat; 100 sq. ft. for 2 coats.

Conco Cement Floor Paint

Description—For coating cement floors above or below grade. Conco Cement Floor Paint prevents dusting and disintegration of floors. It is extremely durable, and resists wear to a remarkable degree.

Covering Capacity—Approximately, 250 sq. ft. per gal. for 1 coat; 150 sq. ft. per gal. for 2 coats.

Marine Waterproof Paint

Description—A decorative and protective coating for application to interior surfaces, swimming pools and surfaces immersed in water. It covers well and adheres firmly. Made in various colors.

Covering Capacity—Approximately, 150 sq. ft. per gal. for 1 coat; 100 sq. ft. per gal. for 2 coats.

Roof Coating No. 5

Description—A pure Trinidad asphaltum product having remarkable adhesive and saturating properties for overcoating and waterproofing roofs of every description. Restores life and waterproofing properties to any roof which had been exhausted by exposure to the sun. It is applied cold with a brush.

Covering Capacity—Approximately, 100 sq. ft. per gal. for 1 coat.

Sterlite Flat Wal-Finish

A high grade washable paint for finishing interior plastered surfaces.

Wal-Wite Enamel and Undercoating (Mill White)

A high grade mill white possessing high light reflecting qualities. Particularly useful for application to walls, ceiling and columns for daylighting interiors. It retains its whiteness and can be repeatedly washed without injuring it. Will not turn yellow.

Fabricators Red Oxide, Carbonite Steel Coating (Structural Steel Coating)

A paint made of the best rust inhibitors or moisture excluders known. For the protection of structural steel. Resists electrolysis to the maximum degree.

Triple Seal System of Waterproofing

This system is used for waterproofing swimming pools, reservoirs, tunnels and basements where the water head is 2 ft. or more. It is a combination of the old membrane and the new integral systems.

Reservoirs, Roaring Creek Water Company, Shamokin, Pa.

GANNETT and FLEMING, Engineers
Two reservoirs waterproofed throughout with Aquabar Integral Waterproofing Compound No. 1. Reservoirs contain approximately 2,500,000 gal. each

THE BITU-MORTAR WATERPROOFING COMPANY, INC.

Manufacturers of Cement Waterproofing; Waterproofing Engineers and Contractors

TELEPHONE
CALEDONIA 5663, 5664

280 Madison Avenue
NEW YORK, N. Y.

Products

"B-M No. 78" BITU-MORTAR LIQUID WATERPROOFING COMPOUND.

Services and Guarantee Bond

Contractors for the execution of waterproofing in all sections of the country, making a specialty of difficult operations where other materials have failed.

Will furnish bond from any bonding company, when required, guaranteeing work to remain absolutely watertight for a long term of years.

An engineering department is maintained, which is at the service of all seeking advice on any questions concerning waterproofing of tunnels, subways, foundation walls, sewers, reservoirs, etc.

"B-M No. 78" Bitu-Mortar Liquid Waterproofing Compound

This is a bituminous emulsion which can be readily incorporated in ordinary portland cement mortar, rendering same absolutely and permanently impervious to water, even under severe pressure.

Mortar so prepared will bond perfectly to either old or new concrete, brick, stone or iron, and can be applied to surfaces even when water is coming through.

FISK BUILDING, 57TH STREET, BROADWAY AND EIGHTH AVENUE, NEW YORK, N. Y.

CARRERE & HASTINGS, Architects

FRED T. LEY, Contractor

Suggestions for Application

NATURE OF WORK
Tunnels, subways, cellar walls.

CONDITIONS
Already constructed. Water coming through floors, ceilings or sidewalls.

MATERIAL REQUIRED
Bitu-Mortar Liquid Waterproofing Compound, "B-M No. 78."

METHOD OF CARRYING WATERPROOFING BACK OF BEAMS

METHOD OF OBTAINING CONTINUOUS COATING WHERE INTERIOR WALL BUTTS AGAINST OUTSIDE WALL

METHOD OF WATERPROOFING UNDER GRILLAGES
A—First operation, "dampcourse"
B—Second operation
C—Third operation, finished floor

Services

WATERPROOFING and DAMPPROOFING ENGINEERS and CONTRACTORS, specializing in "CAFFALL'S SCIENTIFIC PROCESS" of PRESERVING, WATERPROOFING and CLEANING all kinds of buildings above grade.

"Caffall's Scientific Process" of Preservation

This process is the standard method of permanently preserving all masonry exposed to the weather, and is recognized as such by government, state and city authorities as well as by the scientists.

The process consists in applying a special preparation of paraffin and chemicals to the exterior walls of marble, granite, brick, terra cotta, stucco, and masonry of all kinds, either old or new. All stone is porous. Moisture penetrates it, especially when accompanied by strong winds. In communities where there is much smoke from factories, etc., carbon soot settles upon the surface and is carried into the pores by the rain. The union of this soot and moisture gives a sulphuric acid solution which quickly causes stone to crumble. Lime salts and frost also cause quick disintegration and are very damaging, especially when moisture is present.

The compound employed in this process is invisible, insoluble and imperishable. It penetrates the material to which it is applied to a depth of $\frac{1}{4}$ in. or more, depending upon the porosity of the stone, but it is possible to impregnate a brick through its entire thickness. It completely fills all pores or voids, forming an impenetrable barrier to water or moisture and preventing all disintegration.

The preservative used is unaffected by acid and alkali solutions, gases and moisture, and is highly resistant to oxidation. One treatment will last as long as the surface to which it is applied.

"Caffall's Scientific Process" is not an experiment. It has stood the test of time and has an enviable record for durability. Structures treated with it over 50 years ago are still waterproof and in good condition.

Many public buildings of historic interest, as well as churches, monuments, commercial buildings and many private residences have been successfully treated by this process, some of which are:

The Obelisk in Central Park, New York, N. Y.
Fraunces Tavern, Broad Street, New York, N. Y.
The new American Wing of the Metropolitan Museum, New York, N. Y.
Trinity Church, New York, N. Y.
Alexander Hamilton Monument, New York, N. Y.
Christ Church Cathedral, Hartford, Conn.
Buckingham Memorial Fountain, Chicago, Ill.
Residence, I. N. P. Stokes, Greenwich, Conn.
Residence, Carl Tucker, Mt. Kisco, N. Y.

Important Waterproofing Suggestions

There are certain vulnerable parts of the gable walls of buildings, which, if protected against the weather, will go far to insure a dry building. These are the parapet walls. If the average wall is examined, it will be found that the top of the parapet wall is the first

part of the masonry to show signs of disintegration and wasting away of mortar joints. If the following specifications are used, the penetration of dampness will be eliminated.

North and east exposures are always subject to dampness, but the commencement of the trouble is generally at the top of the building.

Specification Suggestions as Alternate Bid

When "Caffall's Scientific Process" is specified, the furring of walls is unnecessary from the standpoint of weather penetration, and no other form of waterproofing is required. This, with our guarantee, assures the architect and owner of a dry building over a long period of years.

Suggestion No. 1—All exterior walls above grade shall be treated with "Caffall's Scientific Process" for preserving and waterproofing, as applied by CAFFALL-CORNMAN CORPORATION, 305 Broadway, New York, N. Y.

Suggestion No. 2—Brickwork of penthouses, bulkheads, side, rear and fire walls topped with stone, tile or terra cotta from roof flashline over and including the coping, down to the lintel level of the top story windows shall be treated with "Caffall's Scientific Process" for preserving and waterproofing as applied by CAFFALL-CORNMAN CORPORATION, 305 Broadway, New York, N. Y.

Suggestion No. 3—Brick or stone work of chimneys above roof flashing shall be treated with "Caffall's Scientific Process" for preserving and waterproofing as applied by CAFFALL-CORNMAN CORPORATION, 305 Broadway, New York, N. Y.

Guaranteed Results

We guarantee that the masonry (stonework, brick or terra cotta) treated by us with "Caffall's Scientific Process" will not discolor, disintegrate, chip, break, crumble or allow the penetration of moisture or water for a period of twenty (20) years from date of treatment; or should any of the aforesaid defects occur during that period, we will treat same where necessary without charge—except in cases due to subsequent settlement of the building foundations or the side thrust of improperly constructed roofing.

Experience and Facilities

Established in 1873, THE PHILIP CAREY COMPANY has enjoyed over a half century of continuous growth. Our Waterproofing Engineers are at your command. Complete information, specifications and estimates gladly furnished on request.

Carey Percoproof (Liquid Dampproofing)

Under ordinary ground conditions two coats of Carey Percoproof (Liquid Dampproofing) applied on the outside of the foundation walls will give a dry basement. It keeps dampness from "percolating" through the wall but is not used where any amount of hydrostatic (water) pressure is present—see Carey Plastic Waterproofing Compound listed below. A black liquid, bituminous material applied cold, similar to paint, with a long handled brush. Covering capacity averages 100 sq. ft. per gallon. See Carey Dampproofing Specification "C."

Carey Percoproof Plaster Bond

Applied directly over rough hollow tile or brick upon which the plaster is to be applied without the use of furring or lathing. A thin, black, liquid, asphaltic compound, like thin paint, which penetrates and waterproofs the walls. Applied in single coat in order to keep the original rough surface of the wall so that the plaster will bond satisfactorily to same. Forms a barrier to infiltration (percolation) of dampness and prevents hideous plaster stains and loosening of the plaster wall. Also used on outside of masonry walls prior to stuccoing. See Carey Dampproofing Specification "B."

Applying Carey Percoproof Dampproofing Compound to the Outside of Foundation Walls

Carey Plastic Waterproofing Compound

A thick, plastic, asbestos waterproofing cement like a putty, applied cold with a trowel to foundation walls for uses similar to Percoproof (Liquid Dampproofing)—see above—except that it will stand moderate hydrostatic (water) pressures of 1 to 10 ft. Send for Carey Waterproofing Specification No. 31.

Carey Waterproofing Felts

These materials are high grade asphalt saturated rag felts.

A waterproof membrane built up of waterproofing felts according to our specification forms a flexible, economical, permanent application.

Carey Waterproofing Asbestos Felts

These felts are especially applicable to waterproofing floors in chemical plants and mill construction on account of their acid, alkali and fire resisting qualities.

Carey Waterproofing Fabrics

These materials are made from 100% pure cotton fabrics thoroughly saturated with a flexible asphaltic compound so as to insure an extremely high tensile strength with a reasonable percentage of stretch. They are applicable in waterproof membranes for railroad bridges and other structures where expansion and contraction or vibration are excessive.

Carey Dampproofing Specification "B"

For Dampproofing the Interior Surfaces of Outside Masonry Walls, Prior to Plastering

(1) **Work Included**—This specification contemplates furnishing all materials and labor required to properly apply Carey Percoproof Plaster Bond to the interior of all outside brick or masonry walls above ground level, prior to plastering.

(2) **Work Not Included**—This specification does not include pointing up masonry or plastering and cementing of any kind. All cracks and holes shall be carefully filled with portland cement mortar, prior to applying Carey Percoproof Plaster Bond. Twenty-four hours after applying Carey Percoproof Plaster Bond the plaster may be applied.

(3) **Materials**—1 coat Carey Percoproof Plaster Bond, 1½ gals. per 100 sq. ft.

(4) **Application**—After all cracks and holes have been filled carefully with portland cement mortar, and the wall is perfectly dry and free from any foreign matter that would interfere with the penetration or bonding qualities of the dampproofing coat, Carey Percoproof Plaster Bond shall be applied uniformly, with a good bristle brush, to the interior of outside masonry walls from grade level to roof.

In cases where the Carey Percoproof Plaster Bond can not be applied to the walls continuously through the floor construction, it shall be applied back on the ceiling for at least 12 in. from the wall.

Carey Percoproof Plaster Bond shall be applied behind window casings and to all cut-outs and recesses in the wall.

Applying Carey Percoproof Plaster Bond Prior to Plastering

A second coat of about 1 gal. per 100 sq. ft. shall be applied to all very absorbent portions of the wall only.

Carey Dampproofing Specification "C"

For Dampproofing the Outside of Foundation Walls, Concrete Bridges, Abutments, Culverts, Retaining Walls and Other Structures Below Ground Level

(1) **Work Included**—This specification contemplates furnishing all materials and labor required to properly apply Carey Percoproof (Liquid Dampproofing) to the outside of all foundation walls below ground level.

(2) **Work Not Included**—This specification does not include pointing up masonry or cementing of any kind. All cracks and holes should be carefully filled with portland cement mortar, and the surface shall be thoroughly cleaned and shall also be smooth and sufficiently dry to obtain good adhesion prior to applying Percoproof (Liquid Dampproofing).

Drain tile may be laid around the footings.

(3) **Materials**—1 coat Carey Percoproof (Liquid Dampproofing) 1½ gal. per 100 sq. ft.; a second coat Carey Percoproof (Liquid Dampproofing) 1 gal. per 100 sq. ft.

(4) **Application**—After all cracks and holes have been filled carefully with portland cement mortar, and the foundation wall is perfectly dry and free from any foreign matter that would interfere with the penetration or bonding qualities of the dampproofing coat, Carey Percoproof (Liquid Dampproofing) shall be applied uniformly with a good bristle brush or spraying machine to the outside of foundation walls from footings to ground level.

Not less than twenty-four hours after applying the first coat of Carey Percoproof (Liquid Dampproofing) a second coat shall be applied.

Carey Waterproofing Specification No. 32

For General Waterproofing

(1) **Work Included**—This specification contemplates furnishing all materials and labor to properly apply the built-up waterproof membrane to (state here surfaces to be waterproofed) below ground or water level.

(2) **Work Not Included**—This specification does not include pointing up the concrete, brick, stone, tile, masonry or cementing of any kind. All cracks, holes and voids shall be carefully filled with portland cement mortar. The surface shall be thoroughly clean and shall also be smooth and sufficiently dry to obtain good adhesion prior to applying the Primer.

(3) **Materials**—Carey Waterproofing Primer (1 gal.) 9 lbs. per 100 sq. ft.; Carey Waterproofing Asphalt No. 114, 50 lbs. per 100 sq. ft.; Carey Waterproofing Felt, 15 lbs. per 100 sq. ft.; Carey Waterproofing Asphalt No. 114, 25 lbs. per 100 sq. ft.; Carey Waterproofing Felt, 15 lbs. per 100 sq. ft.; Carey Waterproofing Asphalt No. 114, 25 lbs. per 100 sq. ft.; Carey Waterproofing Felt, 15 lbs. per 100 sq. ft. and Carey Waterproofing Asphalt No. 114, 25 lbs. per 100 sq. ft. Total approximate weight per 100 sq. ft. to be 179 lbs.

(4) **Application**—Carey Waterproofing Primer shall be applied uniformly and thoroughly brushed in. When the primer has dried to a slight tacky state the surface shall be mopped with Carey Waterproofing Asphalt No. 114, into which, while still hot, shall be embedded the first sheet of Carey Waterproofing Felt. The successive sheets of felt shall overlap the previous sheet 25 in., making eight courses of asphalt and felt, including the primer. All the sheets of felt shall be solidly cemented together with asphalt so that at no place shall felt touch felt.

Reinforce all angles at corners, walls, etc., by cementing with Carey Waterproofing Asphalt No. 114 applied hot, into which shall be embedded one thickness of 15-lb. Carey Waterproofing Felt cut to extend at

least 6 in. each way from the angle. Two such sheets shall be applied—one immediately after applying the primer, and another after the membrane is completed.

Carey Waterproofing Specification No. 33

For Waterproofing Floors in Mill Construction, Alkali, Acid and Fire Resistant

(1) **Work Included**—This specification contemplates furnishing all materials and labor to properly apply the built-up waterproof membrane to the wood floors in mill construction.

(2) **Work Not Included**—All knotholes and open cracks shall be tightly sealed. The floor shall be made free from splinters and nails before applying the waterproofing. Over the membrane shall be laid a second flooring and the flashings on the walls shall be covered with baseboards.

(3) **Materials**—Carey Waterproofing Asphalt No. 114, 25 lbs. per 100 sq. ft.; Carey 35-lb. Waterproofing Asbestos Felt, 35 lbs. per 100 sq. ft.; Carey Waterproofing Asphalt No. 114, 25 lbs. per 100 sq. ft.; Carey 15-lb. Waterproofing Asbestos Felt, 15 lbs. per 100 sq. ft.; Carey Waterproofing Asphalt No. 114, 25 lbs. per 100 sq. ft.; Carey 15-lb. Waterproofing Asbestos Felt, 15 lbs. per 100 sq. ft. and Carey Waterproofing Asphalt No. 114, 25 lbs. per 100 sq. ft.

(4) **Application**—The clean dry base floors shall be mopped with Carey Waterproofing Asphalt No. 114, into which, while still hot, shall be embedded sheets of 35-lb. Carey Waterproofing Asbestos Felt lapped 2 in. Over this shall be applied 2 plies 15-lb. Carey Waterproofing Asbestos Felt overlapping one another 19 in. and also embedded in hot asphalt No. 114.

Reinforce all angles at corners, walls, etc., by cementing with Carey Waterproofing Asphalt No. 114 applied hot, into which shall be embedded one thickness of 35-lb. Carey Waterproofing Asbestos Felt cut to extend at least 6 in. each way from the angle. Two such sheets shall be applied—one prior to applying the first sheet, another after the membrane is completed. A finishing coat of Carey Waterproofing Asphalt No. 114 shall be applied over the entire membrane.

Carey Waterproofing Specification No. 35

For Waterproofing Bridges and Structures Where Expansion and Contraction Are Excessive

(1) **Work Included**—Use paragraph 1 Specification No. 32.
(2) **Work Not Included**—Use paragraph 2 Specification No. 32.

(3) **Materials**—Carey Waterproofing Primer (1 gal.), 9 lbs. per 100 sq. ft.; Carey Waterproofing Asphalt No. 114, 50 lbs. per 100 sq. ft.; Carey Heavy Waterproofing Fabric, 11 lbs. per 100 sq. ft.; Carey Waterproofing Asphalt No. 114, 25 lbs. per 100 sq. ft.; Carey Heavy Waterproofing Fabric, 11 lbs. per 100 sq. ft. and Carey Waterproofing Asphalt No. 114, 25 lbs. per 100 sq. ft.

(4) **Application**—Carey Waterproofing Primer shall be applied uniformly and thoroughly brushed in. When the primer has dried to a slight tacky state the surface shall be mopped with Carey Waterproofing Asphalt No. 114, into which, while still hot, shall be embedded the first sheet of Carey Heavy Waterproofing Fabric. The second sheet of Carey Waterproofing Fabric shall overlap the previous sheet 19 in. and also be embedded in hot asphalt No. 114 so that at no place shall fabric touch fabric.

Reinforce all angles at corners, walls, etc., by cementing with Carey Waterproofing Asphalt No. 114 applied hot, into which shall be embedded one thickness of Carey Waterproofing Fabric cut to extend at least 6 in. each way from the angles. Two such sheets shall be applied—one immediately after applying the primer and another after the membrane is completed. A finishing coat of Carey Waterproofing Asphalt No. 114 shall be applied over the entire membrane.

value as an integral hardener and waterproofing agent.

Ceresit Metallic Hardener

A finely ground and graded metallic compound for incorporation in the top of wearing course of concrete floors. This material is particularly well adapted for heavy duty floors, producing a surface which is dustless and extremely dense and hard. It is furnished in gray or red.

Requirements—25 to 35 lb. to each 100 sq. ft., depending on traffic conditions.

Indurite Liquid Hardener

A colorless liquid for application to concrete floor surfaces. This material greatly increases hardness, and eliminates dusting. The treatment is made in two applications.

Requirements—1 gal. will treat 100 sq. ft.

Craxement Concrete Repair Compound

A special quick-setting repair cement for permanently repairing cracks, holes, breaks and worn spots in concrete floors. It bonds securely to old concrete and produces a hard, dense surface of high strength and wearing quality.

Cerox Colored Cement

A colored waterproof portland cement for use wherever colored concrete surfaces are required. Used in the same manner as standard portland cement. Made in a variety of colors. Eliminates measuring and mixing of colors and cement on the job.

Ceretone Cement Coloring Pigment

Ceretone densifies, hardens, waterproofs and colors cement mixtures. Its greatest use is for colored cement floors. It provides an attractive floor surface which is durable both as to service and permanence of color.

Ceretone colors are red, brown, buff, green and black.

It is shipped in 20 and 100-lb. containers.

Cem-Bric Waterproofing Paint

A specially prepared paint for use on concrete, brick and masonry surfaces. Dries to dense and hard surface.

Ceresit Asphaltic Dampproofing

A heavy asphaltic paint for application on foundations of concrete, brick, or other masonry, below grade, to protect against dampness or surface water. It is also used for a primer and cement coat for membrane waterproofing.

Covering Capacity—For 1-coat work, 1 gal. will cover 60 to 70 sq. ft. For 2-coat work, 1 gal. will cover 40 to 50 sq. ft.

Ceresit Asphaltic Plaster Bond

A heavy asphaltic compound for application to the inside surfaces of outer or exposed walls on which plaster is to be applied. This material prevents injury to the plaster from dampness.

Covering Capacity—For 1-coat work, 1 gal. will cover 60 to 70 sq. ft. For 2-coat work, 1 gal. will cover 40 to 50 sq. ft.

Service

Advisory engineering service available on waterproofing or concrete surfacing problems.

Literature

Bulletins describing materials and containing complete data sent on request.

Ceresit Waterproofing Compound

(a) An integral waterproofing in paste form.
(b) To be added to portland cement mixtures at the time of mixing.

(c) Its use increases workability.

(d) Reduces labor costs in placing.

(e) Permits reduction in water content without loss in plasticity.

(f) Densifies and permanently waterproofs concrete, cement stucco and cement plaster.

Requirements—For mass concrete, use 8 lb. per cu. yd. For portland cement plaster, use 2 to 3 lb. to each sack of cement. For portland cement stucco use 2 to 3 lb. to each sack of cement.

Standard Specification—All concrete [cement plaster] [cement stucco] shall be waterproofed by the addition of Ceresit Waterproofing Compound, an integral waterproofing, manufactured by CERESIT WATERPROOFING CORPORATION, Chicago, which shall be used in accordance with the manufacturer's directions.

Ceresit Waterproofing Powder

An integral waterproofing in powder form. Added to concrete at the time of mixing. This material performs the same function as Ceresit Waterproofing Compound.

Requirements—Use 2 to 3 lb. to each sack of cement. Mix dry with cement before adding water or aggregates to batch.

Cresolac Transparent Waterproofing

A transparent liquid applied with a brush or spray to concrete, brick or other masonry for protection against penetration of water or moisture. This material penetrates the surface pores and makes the treated surface water repellent. It does not affect or change the original color. It is particularly effective on concrete block or tile.

Covering Capacity—Two coats required. 1 gal. covers 200 sq. ft., 2-coat work.

Crescrete Accelerator and Frostproofing

For accelerating the set of portland cement and protection against freezing at low temperatures. Also of

HYDROSEAL WATERPROOFING COMPANY

FORMERLY CONCRETE WATERPROOF PAINT CO.
829-835 North 3rd Street, PHILADELPHIA, PA.

Products

HYDROSEAL BITUMASTIC COATINGS; PENETRIT[®] INTEGRAL WATERPROOFINGS; PENETRIT[®] FLOOR HARDENERS and COATINGS; HYDROSEAL METALTITE; KLING-KOAT CEMENT COATING; MASONRY COATINGS.

Below is a list of the specific materials for the average conditions.

Advantages

Years of specialized experience has taught us that the *proper application* is no less important than the use of the highest quality materials. This has led to the maintenance of reliable men with experience pertaining to the application of waterproofing and dampproofing materials.

In using our materials we co-operate with the architect to see that he receives the results that he desires, as well as to see that the material is being applied correctly.

Our liquid materials such as Hydroseals, Kling-Koat Cement Coating and Penetrite Transparent Waterproofing Compound, are applied by spray under 80-lb. pressure. This method insures the Hydroseal, etc., penetrating the surfaces by force, and at the same time gives the surface a coating, making a

HYDROSEAL

PENETRIT[®]

METALTITE

TRADE-MARKS

perfect plaster bond, dampproof coating or waterproofing.

The many prominent buildings on which our materials have been used successfully are permanent testimonials of the quality of our materials and our knowledge of waterproofing.

Policy

After more than ten years' experience in manufacturing waterproofing materials we are convinced that they should be made only of the highest quality.

From the time we started we adopted the policy of making the very best possible materials. Regardless of competition we have maintained the highest standard of our materials. *Due to our quantity production you can obtain the greatest possible value.*

Our customers appreciate that it does not pay to jeopardize the entire result of the work when the proportionate cost of the waterproofing materials is practically a few per cent of the entire contract. *We have never sacrificed the high quality of our products to meet competition.*

When you use materials manufactured by the HYDROSEAL WATERPROOFING COMPANY you are insuring yourself against unsatisfactory results.

Brands, Uses and Specifications

PURPOSES	MATERIAL	SPECIFICATIONS
For Dampproofing and Waterproofing Concrete, Brick and Cement		
To dampproof exposed walls to be plastered—unfurred or furred with hollow brick, furring tile or concrete blocks.	Hydroseal No. 330	Coat the interior of all exposed walls 1 coat, and, if necessary, 2
To prevent surface infiltration and dampness in basements and cellars	Hydroseal No. 640	Apply 2 heavy continuous coats
For dampproofing the interior of exterior walls above or below grade	Hydroseal Semi-mastic	To be applied (stipulate where) by a 4 knot brush, to be a continuous coating from grade to roof line, 1 ft. on ceiling
To prevent and resist severe conditions of dampness and water below sub-level	Hydroseal No. 640, in conjunction with burlap, felt or cheesecloth.	Apply No. 640, and burlap, etc., alternately 3 to 5-ply until the hydrostatic pressure is equalized
To render waterproof by physical mixture with concrete and cement	Penetrite Integral Waterproofing Paste	For ordinary work add 1 gal. to 32 gal. of water
	Penetrite Integral Waterproofing Powder	Use 2 lb. to a bag of cement; under most severe conditions 3 lb.
An iron waterproofing applied on the inside face of exterior walls below grade, and on top of structural slabs	Hydroseal Metaltite	To be applied and guaranteed by Contract Department of H. W. Co.
Used as an integral waterproofer, an integral hardener, as well as an anti-freeze	Conwatco Mix	Conwatco Mix as waterproofer for mass concrete, use 1 gal. to 15 gal. of gauging water
For Stainproofing Limestone and Marble		
For the protection of limestone, marble, etc., against stain caused by the cement through surrounding masonry	Hydroseal No. 309	Apply to all unexposed sides of stone. 1 continuous coat
To prevent water penetration through old walls of stucco, cement faced brick or stone by an exterior application	Penetrite Transparent Compound	Apply 2 coats, having joints well mortared
For the Protection of Metal		
For prevention against electrolysis and corrosion of exposed structural steel	Hydroseal No. 352	Apply 1 shop coat, to be followed by a field coat, different color
For Waterproofing and Beautifying Concrete and Plaster Surfaces		
To beautify and protect exterior walls of brick, stucco cement, and concrete	Kling-Koat Cement Coating (flat and gloss)	Applied like paint, 2 coats
To prevent water penetration through old walls of stucco, cement faced brick or stone by an exterior application	Penetrite Transparent Compound	Apply 2 coats, having joints well mortared
For Treatment of Floors		
To prevent the dusting and abrasion of concrete floors	Penetrite Floor Finish	Apply 1 coat primer and 2 coats finish. Allow 24 hours between applications
For application after cement or concrete floor is laid. Makes the floor hard, dustproof and waterproof	Penetrite Liquid Floor Hardener	One application is all that is necessary if the condition is not severe
Mixed with the cement to harden and waterproof	Penetrite Metallic Floor Hardener	Approximately 20 lb. to a sq. ft. in the 1-in. top coat
Used as an integral waterproofer, an integral hardener	Conwatco Mix	For mass concrete and top coat use 1 gal. of gauging water. For mortar work use 1 qt. to 1 bag of Portland cement
For Caulking		
	Hydroseal Caulking Compound

Services

We are ENGINEERS and CONTRACTORS for the perfect WATERPROOFING, OILPROOFING, FROSTPROOFING or FUMEPROOFING of any structure of concrete, brick, tile or stone.

Ferro-Tite Method

Ferro-Tite, the iron method of waterproofing, is used in the performance of all of our contracts.

The surfaces are first thoroughly prepared, after which sufficient coats of Ferro-Tite are applied to secure the desired results.

The first coat penetrates the concrete and, on oxidation, expands and perfectly seals all pores of the concrete.

The succeeding coats form a solid sheet of oxidized iron on the surface. After these coats have thoroughly set, slush coats of sand and cement containing Ferro-Tite are applied, which restores the surface to the color of ordinary concrete.

Plaster may be applied directly to this surface, or it may be painted over.

Specifications

Walls—The following surfaces.....shall be waterproofed by the application of Ferro-Tite, the iron method of waterproofing as applied by the CONTRACT WATERPROOFING Co.

Floors—All floors resting on earth shall be waterproofed by the application

of Ferro-Tite, the iron method of waterproofing as applied by the CONTRACT WATERPROOFING Co.

This contractor shall apply his material to the top of the rough slabs for these floors, after which others shall at once apply the finish topping.

Guarantee

We will guarantee any surfaces waterproofed by us to be waterproof and dampproof for a period of ten years, subject to causes beyond our control, such as fractures in walls, etc.

Resistance to Hydrostatic Pressure

Although we prefer to, and usually do, apply Ferro-Tite to the inner surfaces of exterior walls, etc., it will withstand any pressure of water that the walls can withstand. This is also the case where Ferro-Tite is applied to the outside of exterior walls.

Engineers, Architects and Contractors

Write for our handbook on structural waterproofing, which contains valuable information, suggestions and hundreds of references from the foremost architects, engineers and contractors in the country.

Our reputation as waterproofers is based on accomplishment.

Products

No. 60, DES MOINES ELATERITE for WATERPROOFING and BONDING; No. 65, DES MOINES ELATERITE for STONE BACKING.

Also manufacturers of Preservative Paints for all classes of surfaces, including Acid and Heat Resisting Paint, and Metal Protective Paint.

No. 60, Waterproofing and Bonding

No. 60, Des Moines Elaterite, is both a waterproofing and a bonding material. Its base is an intensely adhesive, extremely elastic, non-porous, acid resisting, absolutely waterproof hydro-carbon known as "mineral rubber." It seals the pores of concrete, cement, brick, tile or stone, destroys capillary attraction and provides a continuous film which completely shuts out dampness. In addition, its intensely adhesive quality makes it an ideal bonding material, permitting the direct application to it of plaster or stucco coats.

Uses—For waterproofing all brick, stone, concrete and cement surfaces and as an integral waterproofing to be mixed in concrete or cement mixtures and for bonding plaster, stucco, tile, linoleums, etc.

Advantages—Intensely adhesive, permanent character; extreme resistance to all acids, preventing disintegration; permanent pliability and elasticity, preventing breaking of the waterproof film from hair cracks or expansion and contraction; smooth liquid character, providing a continuous, rubbery blanket; absolute waterproof character, sealing the surface against passage of dampness; combination of waterproofing and bonding, permitting doing away with lath or furring, economizing room and saving in labor and material costs. It meets every waterproofing requirement, thus there is no need to specify a different material for outside foundations, inside walls, basement floors or bonding.

Application—Applied cold, it spreads rapidly with broad flat brushes or may be applied with an air gun or spray. No hot swabbing or layers of felt required and any workman can apply it.

Covering Capacity—100 to 150 sq. ft. (one coat) per gal. or from 80 to 100 sq. ft. (two coats) on cement, brick or stone, depending on porosity; 250 to 300 sq. ft. on wood or metal.

Specifications—(a) *For Waterproofing Substructures*—The waterproofing contractor shall apply a waterproof membrane of No. 60, Waterproofing and Bonding, Des Moines Elaterite, manufactured by THE ELATERITE PAINT & MANUFACTURING Co., Des Moines, Iowa, to the outside of all foundation walls to a point 6 in. above grade, including piers, and to be carried over all footings and properly joined to waterproofing course on outside walls. Membrane to consist of 2 coats properly applied so there shall be no pinholes or uncovered spaces. At least 24 hours must elapse after the application of first coat before applying a heavy second coat, allowing it to dry thoroughly before covering. Walls shall be cleaned thoroughly to remove all loose particles, must be dry and, if of concrete, thoroughly set before applying No. 60, Waterproofing and Bonding, Des Moines Elaterite.

DES MOINES
ELATERITE

TRADE-MARK

Applying Plaster Coat Directly to "Des Moines Elaterite" Waterproofing and Bonding Coat

(b) *For Dampproofing Interior Walls Which Are to Be Plastered, or for Waterproofing Exterior Walls Which Are to Be Stuccoed*—The contractor is to apply 2 coats of No. 60, Waterproofing and Bonding, Des Moines Elaterite, manufactured by THE ELATERITE PAINT & MANUFACTURING Co.,

Des Moines, Iowa, over the inside surface of all exterior walls which are to be plastered, and outside surface of all walls which are to be stuccoed. The walls are to be clean and dry and the application to be so made that there shall be no pinholes or uncovered spaces. At least 24 hours must elapse between the application of the first and second coat, which is to be a heavy coat.

Plaster is to be applied directly over the coating of No. 60, Des Moines Elaterite, after the second coat is "set" but while it is still "tacky," though not sooner than 3 hours after the second application, nor longer thereafter than 10 days. Stucco is to be applied directly over the coating of No. 60, Des Moines Elaterite, while it is "tacky," but not sooner than three hours after application of the second coat nor longer thereafter than 10 hours.

The waterproofing and bonding coats may be applied with air gun or spray, if contractor prefers.

(c) *For Integral Waterproofing Use*—All mortar to be made waterproof must have No. 60, Waterproofing and Bonding, Des Moines Elaterite, as manufactured by THE ELATERITE PAINT & MANUFACTURING Co., Des Moines, Iowa, incorporated integrally, proportioned either with the water used for tempering or with the quantity of portland cement used in the batch in the following manner:

If proportioned with the water used for tempering it should be 1 to 8—1 part No. 60, Des Moines Elaterite, to 8 parts water.

If proportioned with the portland cement it should be 1 gal. No. 60, Des Moines Elaterite, to each 1½ bags of portland cement used.

The No. 60, Des Moines Elaterite, is to be added to the mixture in the foregoing proportions after the water has been put in for tempering, and the mixing is then to be continued until there is complete and thorough distribution throughout the mixture. It must not be added to the water before the latter has been put in for tempering the mixture.

This specification covers mortars for laying up brick or rubble stone; for stucco; plaster for coating the inside of cellar and other walls; for cement floor and roof toppings; for cement slabs to be spread over cinder fill in roof construction; for concrete not subject to heavy water pressure.

For integral mixture in waterproofing concrete which is subject to heavy water pressure the proportion should be changed to 1 part No. 60, Des Moines Elaterite, to 4 parts water used—1 gal. No. 60 to each 4 gal. of water. The No. 60 to be added after the water has been stirred into the mixture and the stirring continued until there is complete distribution.

No. 65 Stone Backing

Specification—All stone to be coated, before setting, on the five unexposed sides; also entire inner surface, including joints, to be coated after the stone is set with No. 65, Stone Backing, Des Moines Elaterite, as manufactured by THE ELATERITE PAINT & MANUFACTURING Co. of Des Moines, Iowa.

Waterproofings, Integral

GF Waterproofing Paste (GF 10)—An ammonium stearate paste used in the gauging water for densifying and waterproofing all kinds of concrete and cement work.

For mass concrete, 1:2:4 or 1:2½:5, mix 1 gallon GF 10 in every 34 gallons of water.

For cement floors, mortar, plaster or stucco, 1:2 or 1:2½, mix 1 gallon GF 10 in every 17 gallons of water.

GF Waterproofing Powder (GF 11)—This product is the same as the water repellent material formed by the combination of GF 10 with cement in concrete and cement work.

For all work mix, dry, 2 pounds of GF 11 with each bag of cement. Especially suitable for cast stone, cement blocks, and other similar work where a minimum of water is used.

GF Cement Accelerator (GF 12)—A colorless liquid to be mixed with the gauging water. It accelerates the set of cement so that concrete and cement work in 2 days is as hard, throughout its thickness, as ordinary work in 30 days. It raises the temperature of the mass and lowers the freezing point of water, so that it becomes a frost preventive, thereby eliminating the necessity of heating water, aggregates or finished work. It densifies the mass and makes cement work waterproof.

As an accelerator, it requires 1 gallon of GF 12 per barrel of cement, being mixed, for cement work, 1 gallon of GF 12 to 10 gallons of water.

As a frost preventive, lowest temperature for the next two hours after placing the work must be anticipated and GF 12 mixed with the gauging water in the following proportions:

Anticipated Temperature	Mixture
29° F.	1 gal. GF 12 to 10 gal. water
24° F.	2 gal. GF 12 to 10 gal. water
17° F.	3 gal. GF 12 to 10 gal. water

GF 14 Ironcote—A finely ground iron powder chemically treated to form a waterproofing for walls and floors subjected to hydrostatic pressure. To be mixed with water and applied with a brush in 4 or 5 coats to the surfaces of old or new construction required to be waterproofed.

Waterproofings, Membrane

GF Bitumen (GF 17)—A high grade pure bitumen to be melted and used hot, with either GF 18 Waterproof Felt or GF 21 Saturated Fabric. Remains elastic at zero and will not run or slide at 140° F.

Physical Properties GF 17

Weight per gallon.....	8.71 lb.
Specific gravity 60° F.....	1.05
Melting point B & R.....	150° to 170° F.
Flash point.....	450° F.
Ignition point.....	550° F.
Ductility 77° F. 5 cm. per min.....	20 cm.
Evaporation 320° F. 7 hrs.....	0.09%
Loss 50 gr. 5 hrs. 325° F.....	1%
Penetration: 32° F. 200 gr. 60 sec.....	10
77° F. 100 gr. 5 sec.....	28 to 40
115° F. 50 gr. 5 sec.....	75 to 100
Soluble in: Carbon disulphide.....	99.8%
Carbon tetrachloride.....	99.8%
86° naphtha.....	68%
Analysis: Ash.....	Trace
Sulphur.....	2.2%
Paraffin.....	0.7%
Coal tar.....	None

Quantities Required GF 17

2-ply work.....	13 gal. per 100 sq. ft. of surface
3-ply work.....	17 gal. per 100 sq. ft. of surface
1 mop coating.....	5 gal. per 100 sq. ft. of surface

On concrete it is better to use first a priming coat of GF 16 to give proper bond and penetration to the GF 17.

GF Waterproof Felt (GF 18)—A strong, bitumen-saturated felt, made of all rag stock weighing 15 pounds per 100 square feet, single-ply. Each fiber is coated and impregnated with bitumen. Used with GF 17 Bitumen in alternate layers of GF 17 and GF 18 to form a built-up membrane waterproofing.

For ordinary work use 2 plies of GF 18 and 3 coats of GF 17. Against water pressure use 3 plies of GF 18 and 4 coats of GF 17.

GF Saturated Fabric (GF 21)—A cotton duck fabric, saturated with GF 17 Bitumen. For use in deep foundations or on bridges and floors subject to vibration and stresses.

Use 2 plies of GF 21 and 3 coats of GF 17.

Physical Properties GF 21

Width unsaturated.....	37 in.
Width saturated.....	36 in.
Weight unsaturated, per sq. yd.....	5 oz.
Weight saturated, per sq. yd.....	13 oz.
Min. tensile strength per lin. in. lengthwise.....	65 lb.
Min. tensile strength per lin. in. crosswise.....	50 lb.
Threads per lin. in.....	22 to 26
Flexible.....	0-250° F.
Stretch.....	10%

Dampproofings

GF Brush Coating (GF 16)—A pure bitumen paint, applied cold as a brush coating to the exterior faces of walls below grade, and on concrete underbed below wood floors and sleepers. Applied in 1 coat, afterwards touching up any bare spots. Never use any kind of brush coating on the interior of a wall below grade, but use portland cement plaster with GF 10.

GF Mastic Cement (GF 250)—A heavy plastic coating, applied cold with a trowel for the same uses as GF 16.

Can be applied to damp surfaces, such as newly built concrete walls where it is desired to proceed with the backfilling at once. Also as a dampcourse across footings or over tops of foundation walls, turning up 6 inches on inside faces of walls.

Made also in colors for use in calking around window frames, and pointing up joints and cracks in masonry or stucco.

GF 270—A special form of GF 250 made in light and dark gray of a heavy consistency to be used by hand for calking purposes.

GF Transparent Waterproofing (GF 100)—A transparent, pore filling liquid containing 38% of waterproofing elements, which remain, as a water repellent filling, after the volatile vehicle has evaporated. For waterproofing exposed exteriors of brick, stone, stucco or concrete, and interiors of tanks and reservoirs. Prevents efflorescence and staining or discoloring. Must not be applied when temperature of the surface is below 60° F.

To be applied in 2 coats at intervals of 24 hours, all open joints and cracks being first pointed up with GF 250 Colored.

GF Brick and Cement Coating (GF 101)—A high grade paint for the same uses, under the same conditions, as GF 100. It is unaffected by the alkalis and lime of cement and will not crack or peel. Made in various colors.

Applied in 2 coats under the same conditions as GF 100.

GF Thinner (GF 101)—To be mixed 1 gallon with 5 gallons GF 101, to form a priming coat for GF 101, on new or absorbent surfaces.

GF 102 Cement Paint—A dry cement paint powder to be mixed with cold water. For application with a brush or spray to any kind of masonry or wood exterior walls or interior walls and ceilings. Made in light and dark red, gray, buff, green, white and ivory.

GF Dampproof Coating (GF 200)—A bitumen paint to be applied to interior surfaces of exposed brick, stone or tile walls above grade. Dries tacky so that lime plaster can be applied directly to it any time within 30 days. Must not be applied to cement surfaces, unless a mechanical bond for the plaster is obtained by chipping, and must never be applied to any surface intended to receive a portland cement plaster. (Use GF 10 integrally.)

Applied cold with a brush, so that surface is black and shiny, giving all bare spots a second coat.

Analysis GF 200

Gravity at 60° F.....	20°
Specific gravity at 68° F.....	0.957
Non-volatile components consisting of pure bitumen (Gilsonite 20%).....	60%
China, wood oil and volatile vehicle consisting of a distillate of a bitumen base.....	40%
Coal tar or pitch.....	None

GF Stainproof Backing (GF 220)—A bitumen paint to be applied cold to the built-in parts of all cut stone, to prevent staining and discoloration through penetration of alkalis and moisture from the masonry.

Analysis GF 200

Bitumen.....	60%
Volatile vehicle.....	40%
Coal tar or pitch.....	None

Applied cold with a brush, either at the yard or on the ground, touching up all bare spots just before building in.

GF Crystalrox (GF 145)—A fine white powder to be dissolved in water and applied to the exposed faces of all cut stone, marble or cement work, to harden the surface and prevent stains and discolorations.

Also for application to freshly lime or cement plastered walls, to interpose a neutralizing film between the caustic alkalis of the surface and the decorative finish.

Dissolved in water and applied in 2 coats as follows:

1st coat—2 pounds GF 145 in 1½ gallons of water.

2nd coat—2 pounds GF 145 in 1 gallon of water.

Floor Hardening and Preserving

GF Cement Accelerator (GF 12)—Described before under Waterproofings. Used in the mixing water in proportion of 1 gallon of GF 12 to 10 gallons of water will harden and set the floor throughout its thickness in 2 days, as ordinary work in 30 days.

Made also in colored paste form, red, brown, buff, gray and green to make an integrally colored cement floor equal in appearance and durability to tile. Use minimum of ½ gallon of red, 1 gallon of green or ¼ gallon of each of the other colors per bag of cement, increasing these quantities if a deeper color is desired.

GF 12 Colored Wax—A floor wax made in the same colors as GF 12 colored, for application to colored cement floors to give a gloss finish and to rectify patchiness of the surface due to poor workmanship in laying.

GF Metallic Hardener (GF 140)—Pure iron particles properly graded and specially treated to become temporarily non-absorbent. To be mixed dry with equal weight of cement and troweled on to the surface of a cement floor at time of laying. Use 15, 25 or 30 pounds of GF 140 per 100 square feet of surface, according to severity of wear.

GF Crystalrox (GF 145)—A colorless powder to be dissolved in water and applied in 2 coats to the set up surface of an old or new cement floor.

1st coat—2 pounds GF 145 in 1½ gallons of water.

2nd coat—2 pounds GF 145 in 1 gallon of water.

This gives a 17% solution of chemical hardener over every foot of surface. Floors can be used between applications.

GF Floor Enamel (GF 155)—A colorless or colored cement floor paint containing a minimum of pigment, just sufficient to hide or cover any stains or discolorations of the surface, being unaffected by the alkalis of cement. Applied in 2 coats with an interval of 24 hours between. Very dusty, porous floors or floors laid directly upon the ground should first receive a priming coat of GF 155 Transparent. Made in colorless, red, brown, gray and green.

GF Wood Floor Preservative (GF 160)—A highly wear resistant transparent oil filler and finish combined, for either hard or soft wood floors, that is unaffected by water, oils, alkalis, etc. Prevents dry rot, shrinkage and splintering. Gives an eggshell, gloss finish, that can be varnished, waxed or polished. One coat sufficient for years of constant wear. Surfaces must be clean and dry.

Roofings

Membrane GF 17, GF 18, and GF 21—Described previously under Waterproofing. Use 3 plies of GF 18 Felt, each stuck and coated with hot GF 17 Bitumen, using altogether 17 gallons of GF 17 per 100 square feet of surface, or, 2 plies of GF 21 Fabric similarly stuck and coated with GF 17, using altogether 13 gallons of GF 17 per 100 square feet of surface. If the GF 21 is turned up 6 inches on parapet walls, etc., no metal flashings will be required.

Plastic GF Mastic Cement (GF 250)—Previously described under Dampproofing. To be applied cold with a trowel to any kind of new or old roof surface, forming a tough, elastic waterproof coating, that will be unaffected by the elements. In all cases, except tin or metal, apply first a brush coat of GF 250 Primer. Form 6 or 8-inch flashings of GF 250 on all

parapet walls, etc. If roof is to be walked on, cover with a single layer of GF 18 Felt.

GF Primer (GF 250)—A brush coating to be applied cold to all porous surfaces as a primer for GF 250 Mastic Cement.

GF 250 Brush Coating—A brush coating, containing asbestos fiber and of a similar nature to GF 250 Mastic Cement, to be used cold for recoating and repairing all kinds of built-up membrane roofings.

GF 250 Colored—A trowel coating, for the same purpose as GF 250 Mastic Cement, made in brown, red, gray, buff and green.

Coatings for Structural Steel, Iron and Timber

Steel and Iron—GF 300 Steel Coating—A shop coating for structural steel, composed of zinc and lead chromates with Jellatung rubber resin and China wood oil, forming a rust inhibitive, elastic, protective coating; 1 coat to be applied before assembling and a second coat after riveting is completed. If a colored finish is desired for exposed work, such parts to receive a final coat of GF 300 after erection.

GF Alkali Coating (GF 325)—A bitumen paint containing only 34% of volatile vehicle. To be used over GF 300 as a final coat on structural steel embedded in masonry or exposed to the weather. Insulates and prevents electrolytic action.

GF Galvanic Primer (GF 350)—A transparent coating that penetrates the greasy film left by the galvanizing process, bonds to the iron and forms a bond for any ordinary linseed oil paint.

Applied in 1 coat to a clean, dry surface.

Timber—GF Timber Preservative (GF 550)—A combination of creosote, zinc salts and copper, for application to structural timbers to be embedded in earth or masonry, or exposed to the elements. Prevents dry rot and disintegration from heat, cold, dampness, oils, insects and fungi. Applied cold as a brush coating or by dipping.

GF Wood Preservative (GF 160)—Described previously under Floor Hardening and Preserving. By combining with the natural saps of the wood it protects them against drying out or rotting away, which causes shrinkage cracks in trusses, posts and other structural members.

Applied in 1 coat to a clean, dry surface.

Acidproofings

GF Acidproofing (GF 99)—A transparent brush coating to be applied to any structural surface, forming a durable film that renders the surface immune to the action of acetic acid, alcohol, alkalis, ammonia, blood, caustic soda 50%, disinfectants, ensilage, garbage, hydrochloric acid 25%, lactic acid, live steam, malic acid, molasses, muriatic acid, oxalic acid, picric acid 25%, septic fluids, sewage, smoke, sodium chloride, sugar, tannic acid, wine.

GF Bitumen (GF 17)—Previously described under Waterproofings. Applied hot to protect against alum, ammonia, hydrofluoric acid, hydrochloric acid, mineral acids and dilutes, nitric acids, picric acid, sulphuric acid.

GF Crystalrox (GF 145)—Previously described under Floor Hardening and Preserving. Dissolved in water and applied in 2 coats to protect concrete and cement work against creosote, lactic acid, malic acid, molasses, sugar.

GF Bitumen Paint (GF 220)—Previously described under Dampproofing. Applied cold with a brush to protect against acetic acid, mineral acids and dilutes, cyanides.

Bonding Concrete

GF Bonding Compound (GF 400)—A combination of chemicals, forming a powerful acid powder to be dissolved, 2 pounds of GF 400 in 1 gallon of water, and applied to any concrete or cement surface, floor or walls, to open the pores and expose fresh cement and aggregate to afford a monolithic bond for new work; developing a bonding strength of 80 pounds per square inch.

Oilproofing Concrete

GF 141—A finely ground pure iron powder for mixture with cement and sand, 1 part GF 141, 3 parts cement, 1½ parts sand; to be wet up and applied in 2 coats, scratch and finish, to a total thickness of about ½ inch, as an oilproof, plaster coat finish, to walls and floors of concrete oil storage tanks.

Service and Handbooks

The Waterproofing Handbook covers all ordinary problems in waterproofing, dampproofing and preservation of different parts of building construction. We also maintain a Waterproofing Service Department at Youngstown, Ohio, whose advice and assistance are supplied without cost or obligation.

Products

HYDRATITE INTEGRAL WATERPROOFINGS for concrete; DEHYDRATINE DAMPPROOFING COMPOUNDS; SYMENTREX, Decorative Waterproof Coating for concrete and masonry; KONCREX, Decorative Coating for cement floors; VULCATEX CALKING COMPOUND, for windows and joints; HORN'S DRY COLORS for coloring cement, mortar and stucco; STAYBRITE for coloring, hardening and waterproofing cement floor finish in one operation; HORNSTONE CRYSTALS for dustproofing and hardening cement floors; FERRO-FAX METALLIC FLOOR HARDENER; TRIPLEFLEX COTTON FABRIC for membrane waterproofing; KERAMIK KEMIK PROCESS for producing pottery effects in concrete.

Also Kopper Karbol Wood Preservative; China Flat Wall Paints; Bondsit for Bonding Old and New Concrete; Expansion Joint Cement; Durock, a Decorative Waterproof Coating, can be applied on green concrete and wet surfaces.

Service

We have a waterproofing engineering staff that designs materials and methods for unusual situations, offered gratis to engineers, architects and contractors. *An architect's folder, containing specifications on individual sheets*, offered free on request.

References

In our thirty years of experience, we have had tests made by governmental departments, engineers, laboratories, etc., and we have a long list of jobs where our materials have given satisfactory service in every section of the world.

Hydratite Integral Waterproofing Compound

A compound to be mixed with cement to make permanently watertight concrete mixtures. Made in paste and powder form. Paste is a white, smooth material to be dissolved in gauging water and distributed by it through the concrete or cement mortar. In mass concrete, use 1 part to 33 parts of water; in cement plaster and stucco work, 1 part to 17 parts of water.

Dehydratine Dampproofing Coating

These black compounds are applied to the inside surfaces of exterior brick, stone and terra cotta walls, dampproofing them and providing insulation. Dehydratine No. 1 brush coating for use on brick, stone or terra cotta. Dehydratine No. 10 trowel coating for use on brick walls only. The use of these materials eliminates the necessity of furring and lathing. Gypsum plaster may be applied directly to the dampproof film thus provided.

Dehydratine No. 2 Transparent Exterior Waterproofing Brush Coating

A transparent liquid for dampproofing and reducing the porosity of brick, stone, stucco, masonry or concrete surfaces. It is applied with a brush and has a high penetrating capacity, thereby completely filling the pores and preventing absorption. It is applied on the outside of the building only.

Dehydratine No. 3 Stone and Trim Stainproofing Backing

A specially prepared, quick-drying, black, brush coating to be applied on all unexposed surfaces of cut stone or of wood trim.

Vulcatex Calking Compound

Vulcatex is a permanently elastic material, unaffected by the changes in temperature: Is unexcelled for calking windows, pointing up terra cotta and masonry joints, and for

expansion joints in concrete or masonry. It is made in gray, red, and brown.

Hornstone Crystals

A chemical floor hardener composed of mineral salts, dissolved in water. It is flushed over cement floors, producing a harder, more compact and dustless surface, that is proof against absorption of all liquids for all time. It can be used on old or new floors.

Ferro-Fax Metallic Floor Hardener

A ground metallic aggregate and hardener introduced into the top surface of cement floors when laid, and mixed with cement finish coat or topping. Ferro-Fax insures a smooth, hard, dense surface that withstands severe traffic. Furnished in gray, black, red or green.

Keramik Kemik Process (Patent Applied For)

A balanced penetrant which reacts chemically with the lime content of the portland cement in floors, producing the color effects which are ordinarily obtained in pottery by the burning-in of similar metallic salts by fire. The possibility of scoring the concrete to resemble tile suggests unlimited appeal of texture and color similar to Rookwood.

The finished floor is hard and dustproof as well.

Gives same desirable results when used with stucco.

Staybrite (Integral Coloring, Waterproofing and Hardener for Cement Floor Topping)

This material integrally colors, hardens and waterproofs cement floor topping in one operation. Furnished in following colors: Tile Red, Mexican Red, Japanese Black, French Gray, Persian Yellow, Alaskan Brown, Linoleum Brown, China Blue, Egyptian Green.

Horn's Dry Colors—Coloring for Cement, Lime and Composition Mixtures

These colors are high grade metallic oxides, and have great tinctorial strength. They are unaffected by the actinic rays of light as well as by the various chemical reactions prevalent in cement mortar and masonry.

These colors are economical as but small quantities are required to the bag of cement, and because of the small percentage needed to permanently color cement for floors and mortar, the strength of the cement is maintained.

Quantities Required per Bag of Cement—Tile Red, 8 lb.; Mexican Red, 8 lb.; Japanese Black, 3 lb.; Persian Yellow, 8 lb.; Alaskan Brown, 10 lb.; Linoleum Brown, 10 lb.; China Blue, 8 lb.; Egyptian Green, 8 lb.

The foregoing proportions are for maximum depth of color. Lighter shades are obtained by reducing the quantity of color per bag of cement used.

Dehydratine No. 80 Liquid Integral Cement Accelerator, Antifreeze Compound and Hardener

A liquid compound to lubricate, harden and permanently strengthen cement, mortar and concrete mixtures. Cuts the time and labor by accelerating the set of cement. In freezing weather, it acts as an Antifreeze, makes cement mortar more "fatty" and increases the bond in masonry work. It is mixed in the gauging water.

Koncrex Liquid Protective Coating for Cement Floors

Prolongs the life of cement, producing a hard, dustproof, washable surface, impervious to the destructive action of oils and other liquids.

THE HYDROLITHIC WATERPROOFING CO., INC.

Engineers and Contractors for Waterproofing
1401-2 Commonwealth Building, PITTSBURGH, PA.

TELEPHONE, COURT 1161, 1162

EASTERN REPRESENTATIVE: TAYLOR-HYDROLITHIC Co., 32 Pearl Street, NEW YORK, N. Y.—Telephone, Bowling Green 5055

Services

We are ENGINEERS and SPECIALISTS for WATER-PROOFING, making a specialty of Cement Coat Waterproofing.

We contract for the waterproofing of basements, subways, reservoirs, vaults, tunnels, swimming pools, boiler rooms, elevator pits, etc.; guaranteeing a positive and permanent waterproofing for all kinds of masonry construction.

Our Engineering Department is always at the service of architects, contractors, or others.

Advantages

The advantages of our Hydrolithic System over the old membrane method or integral waterproofing are many, as follows: it is permanent; it is cheaper, no extra supporting walls are required; no additional floor finish is necessary; ease and economy with which repairs can be made; it can be applied without delaying the other building trades; it can be applied as readily to old buildings as to new; it forms a good wearing surface on the floor and an attractive wall finish; it is not affected by heat and can be used in boiler rooms and other places where the heat would destroy pitch and felt waterproofing.

Thirty Years without a Failure

All work is executed in the well-known Winslow's Hydrolithic System which was invented by E. J. Winslow more than 30 years ago. It is the original plaster coat method and, although its wonderful success has inspired a host of imitators, it is still easily the leader in its field. During the thirty years it has been in use, we have not had a failure.

Application

Hydrolithic is applied as a cement plaster coat to the inside of exterior walls and top of floors. Wall coatings are $\frac{5}{8}$ in. and floor coatings 1 in. thick, all surfaces being thoroughly chipped and cleaned before application. Due to the special qualities of Hydrolithic and the expert care with which it is applied, a perfect bond is secured. Hundreds of successful installations are in existence all over the country where Hydrolithic has for many years remained absolutely dry, although subjected, in some cases, to very high hydrostatic pressure.

Registered

HYDROLITHIC

TRADE-MARK

Specifications

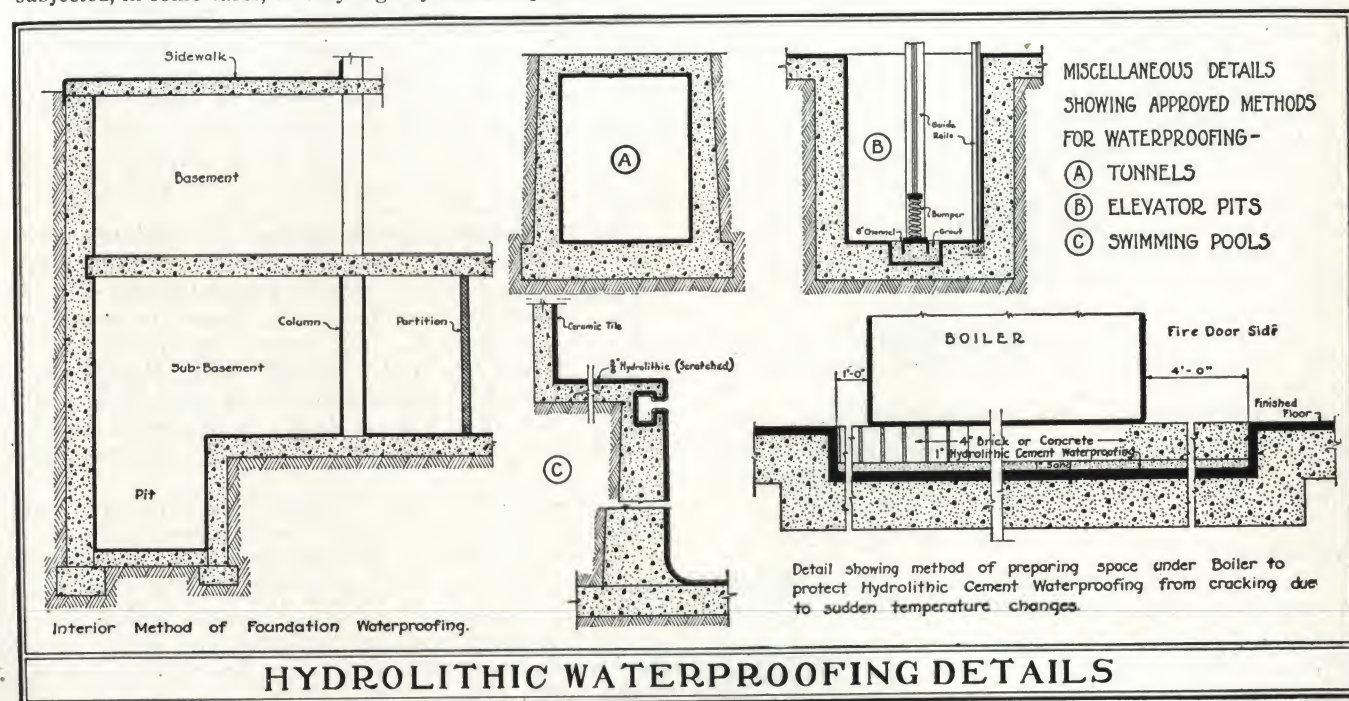

The interior surface of all exterior walls to a height of . . . feet above the finished basement floor and the upper surface of the concrete floor slab of the entire basement [sub-basement] as well as all trenches, pits and machinery foundations shown on the plans, shall be waterproofed with Winslow's Hydrolithic Cement Coatings, applied by THE HYDROLITHIC WATERPROOFING CO., INC. All surfaces, before waterproof coating is applied, shall be thoroughly chipped and cleaned. Wall coating shall be $\frac{5}{8}$ in. thick, applied in 2 coats, thoroughly floated and troweled to a smooth and even finish, free from imperfection. Floor work shall be 1 in. thick and serve the double purpose of a waterproofing agent and a wearing surface. Floor coating shall be floated and finished as described for wall coating.

Guarantee—THE HYDROLITHIC WATERPROOFING CO., INC., shall furnish a written guarantee covering their work for a period of three years. During this time they shall, at their own expense, promptly repair any leaks which may develop; providing such leaks are not due to structural changes in the building or to external damage to the waterproofing for which they are not responsible.

CHICAGO, ILL., Tacoma Building

Karnak Membrane Waterproofing System

The Karnak system is based on the use of a highly refined and very ductile asphalt, reinforced and held in place by a strong elastic interlocking membrane, made of cotton cloth saturated with asphalt. Because Karnak asphalt contains no impurities or foreign matter and because this waterproofing is held in place by a strong elastic binder, less plies are required than in felt systems. In the usual case, 2 plies of Karnak fabric with 3 heavy moppings of Karnak asphalt will give absolutely adequate results.

Uses—This system will be found to be thoroughly dependable for use on building foundations, bridges, viaducts, pump wells, retaining walls and wherever sub-level construction is exposed to water pressure.

Karnak Asphalt—Melting point 150° to 160° F.; penetration at 32° F. not less than 10, at 115° F. not more than 100; ductility at 77° F. not less than 30 cm.; loss in weight and penetration under the standard A.S.T.M. heat test, less than 0.5% and 10%, respectively.

Karnak Fabric—An elastic cotton fabric, thoroughly impregnated with Karnak Asphalt, having a minimum tensile strength of 50 lbs. per in. and a minimum stretch of 10% in either direction. The thread count shall be between 18 and 26 threads per inch assuring an open mesh. The raw weight shall be less than 4½ oz. and the saturated weight from two to three times the raw weight.

Architects' Specification—The waterproofing course shall consist of 2 plies of Karnak Fabric and 3 layers of Karnak Asphalt, applied in strict accordance with the manufacturer's directions.

Tests—Every lot of asphalt and fabric is tested at the source by an independent laboratory which places its seals and identification numbers on each package. A copy of this test will be sent directly to the architect by the testing laboratory.

Publications—We have bulletins covering all points: a technical discussion of bituminous waterproofing; lists of architects, engineers and railroads who use Karnak; lists of typical Karnak installations; detailed descriptions of some particularly interesting projects.

Karnak Cut-backs and Plastics—We make a complete line of primers, brush plastics, trowel plastics, joint fillers.

Karnak Special Purpose Asphalts—To meet the needs of manufacturers. State your needs to our Engineering Department.

Karnak Roofing—The same as the waterproofing blanket. Particularly adaptable for roofs protected with tile or concrete because the expansion of the surfacing will not tear the roofing blanket.

Krodeproof

A Preventive of Corrosion and a New Method of Applying Asphalt as a Waterproofing Agent—Krodeproof consists of minute particles of asphalt suspended in water. When applied to any surface, wood,

steel or concrete, the water evaporates and the asphalt particles flow together and coalesce, leaving a protection coating of asphalt.

Advantages—Krodeproof, being a dispersion of asphalt and water, is always applied cold. It can be applied to damp or dry surfaces with an air spray, brush or trowel; and it may be built up to any thickness. After the Krodeproof has set up it will not flow, bleed or run at any temperature up to 300° F.

Uses—Krodeproof is most effectively used wherever protection is required against moisture, acid or alkali fumes.

Users—Railroads; against locomotive gases, brine drip and on the decks of concrete bridges, and retaining walls.

Marine; against salt water corrosion.

Contractors and engineers; against moisture below grade for cut stone backing and for surfacing roofs.

Hydro-electric plants; on penstocks, transmission towers, etc.

Manufacturing plants; for lining coal bunkers, for lining acid chimneys, boiler setting compound, etc.

Coverage—80 sq. ft. per gal. on steel; 40 sq. ft. per gal. on concrete.

Korkseal

Korkseal is an asphalt plaster used for the protection of cork board insulation. It is made from Krodeproof mixed with asbestos, which gives a smooth-troweling plastic, very easy to apply, firmly bonding to the corkboard—setting up into a tough rubbery protection coating which will not crack, and will not permit the penetration of moisture into the corkboard—thereby preserving the original usefulness of the insulating material and preventing the absorption of odors.

Engineers and contractors have found Korkseal more efficient, and less expensive. A representative list of installations will be sent on request.

Refrigeration Specifications—To maintain the efficiency of corkboard as an insulator, it must be kept dry; to do this it is necessary to keep all "live" air out of the corkboard. Therefore: (1) Prime the masonry wall with Krodeproof. (2) Erect the corkboard to the primed masonry wall with 180° M.P. Karnak Asphalt. (3) Protect exposed surface with a ¼-in. coat of Korkseal. All of these materials to be applied strictly in accordance with the instructions of the manufacturer.

Korkseal for Pipes—An asphalt plaster made from Krodeproof and inert materials producing a softer surfacing than Korkseal. Korkseal for Pipes is applied cold with a trowel, on to the surface of the cork pipe cover after installation, giving a seamless asphalt coating which protects the cork perfectly, and at the same time makes a less expensive job, but one more attractive in appearance.

Consultation and Service

The pages which follow present, in condensed form, complete data on Minwax products. A more detailed discussion is furnished in separate bulletins, which will be gladly furnished on request. Our engineers will present complete recommendations on design and specifications and furnish estimates either on the entire problem or on some specific detail or question. Consult with local representative where possible, or write direct giving details as completely as practicable.

Through 21 years of study and experience in this

field, our purpose has been to develop for each problem the material best suited for that particular group of conditions. The record of accomplishment made by each product establishes its outstanding efficiency and permanence, and, in many cases, has created new standards of service.

To list or recount the accomplishments of these years in the limits of this catalogue is impracticable, but complete detailed data and a list of nearby installations will be gladly furnished on request.

To assist the architect in immediately locating information on the kind of work he is interested in, we are furnishing a paragraph index below. Necessarily this index cannot perfectly cover all the possibilities of the several materials, but the heading and descriptions will suggest further uses.

Guide and Index for Minwax Materials

KIND OF WORK	PARAGRAPH No.	KIND OF WORK	PARAGRAPH No.
Below Ground Level		Roofs, Terraces, Porches, Sidewalks, etc.	
Dampproofing Foundations and Retaining Walls	13-16	Expansion Joints for Sidewalks or Vault Lights (Filling Cement).....	17, 18
Dampproofing on Damp or Green Concrete....	28-30	Surface Waterproofing or Stainproofing for Tile or Concrete Deck or Porch.....	52-54
Dustproof Finish for Basement Floors.....	52, 53	Waterproofing (Membrane) under Tile or Concrete Deck.....	1-7, 11, 12
Joints between Footings and Walls.....	21-25	Inside the Building	
Waterproofing (Membrane) Against Pressure.	1-6, 10-12	Binder for Soft, Sanding Concrete Floors....	57, 58
Outside Walls Above Ground		Concrete and Magnesite Floor Treatments	
Efflorescence or Salts, Prevention of.....	31-34, 36	Dustproofing, Stainproofing.....	52, 53
Elastic Caulking for Terra Cotta and Stone Joints	22, 27	Color Staining and Dustproofing.....	55, 56
Joints between Brick and Concrete Spandrels and Pilasters or Beams.....	21, 25, 26	Cork Board Insulation, Waterproofing and Protection for.....	29
Painting and Waterproofing Exposed Walls of Concrete Brick or Stucco.....	43-46, 47-50	Joints in Concrete Floors.....	17
Pointing (Waterproof) for Joints in Brick or Cracks in Stucco.....	35, 50	Maple Floors, Preservative Finish	
Spandrel Waterproofing.....	21, 26	Partial Penetration.....	65
Stainproofing Cut Stone.....	31-32, 38-42	Complete Penetration.....	66, 67
Waterproofing Outside Walls without Changing Color for		Painting Concrete Floors.....	59
Concrete	31-35, 37	Patching Cement Floors.....	28-29
Red Brick.....	31, 35, 37	Protective Coating against Water, Acids, Gases, Brine, etc. for Wood, Metal and Concrete	28-30
Cream Face Brick.....	31-32, 38, 40, 50	Terrazzo, Clay Tile Floors, etc., Stainproofing etc.	52, 54
Cut Stone (new).....	31-32, 38, 39, 41	Waterproofing (Membrane) Shower Stall and Floors	1-5, 9, 11
Existing Stone Work.....	42	Waterproofing (Membrane) Swimming Pool...1-5, 8, 11, 12	
Waterproofing Inside Underneath Plaster.....	51	Wax Finishing, for Wood Floors and Trim...69	
Waterproofing Cut-off or Bed for Window Heads or Sills.....	21 25	Wood Floors and Trim, Architectural Finish, Stain and Wax.....	60-64, 68, 69
Window Caulking and Glazing Compounds			
Black Compound for Steel Sash, Hanging Stile, etc.....	20, 23, 24		
Gray or Colored Compound for Caulking and Glazing.....	22-24		

Minwax Membrane Waterproofing System

(1) **For Bridges, Pools, Reservoirs, Tanks, Subways, Floors, Roofs, Foundations, Sidewalks, etc.**—The Minwax Membrane System is the original cotton fabric or elastic system. It consists of hot mopping of Minwax Waterproofing Asphalt reinforced with Minwax Fabric which has previously been saturated with the same asphalt.

The asphalt possesses four requisite qualities to an unusual degree: Permanence, elasticity at all temperatures, toughness at all temperatures, and smooth flowing and high filming qualities.

Minwax Fabrics are woven from a long-fiber cotton and embody to the highest possible degree all the necessary properties: permanence, strength and elasticity at all temperatures, ease in handling and placing without wrinkles. They become an integral part of the mopping courses.

Note: The MINWAX COMPANY, INC. manufactures two standard Fabrics: Specification Fabric 80-lb. strength, Cotton Cord Cloth 50-lb. strength. Higher strength will give greater protection and is generally recommended. Bulletin No. 31 gives complete data.

(2) **Uses**—The Minwax Membrane System is recommended by the Joint Committee on Concrete and Reinforced Concrete for all locations where thorough waterproofness is required. Being elastic and stretchable, it is the logical system for slab, pool, floor or deck conditions exposed to variations in temperature or vibration where danger of cracking or checking definitely exists.

(3) **Tests**—Pittsburgh Testing Laboratories show an elasticity of over 10% for the completed waterproofing.

Tests by Columbia University show that the completed waterproofing will stretch, without rupture, $\frac{1}{4}$ in. at 0° F. under field conditions.

Tests by the Pittsburgh Testing Laboratories show that the completed 2-ply unsupported membrane is waterproof up to a bursting pressure of 374 lb. per sq. in.

(4) **Approvals**—Since introduced by this company in 1906, the Minwax Membrane System has established the standard of waterproofing efficiency. The results obtained with the Minwax System definitely established the superiority and greater final economy of the cotton fabric system over all others in the face of slightly higher first cost, and largely formed the measure for the standards established by the American Society for Testing Materials, American Specification Institute, Federal Specifications Board and the United States Bureau of Standards.

Minwax materials meet and exceed all requirements of these specifications and deliver many valuable properties which could not be included in a general open specification.

(5) **How Shipped**—Fabric, 50-yd. rolls 36 in. wide; asphalt, 50-gal. sheet metal drums.

(6) **Specification**—The waterproofing shall consist of not less than 2 plies of Minwax Specification Fabric (Cotton Cord

Cloth) and 3 moppings of Minwax Waterproofing Asphalt applied by experienced mechanics in accordance with the manufacturer's directions.

All surfaces shall be smooth, firm and temporarily dry. Completed work shall be protected from puncture.

(7) **Slabs, Sidewalks, Floors, Promenades, etc.**—Membrane waterproofing shall be continuous, extending over and into expansion joints and connected to wall waterproofing, or flashed 3 in. above finished grade.

(8) **Pools, Tanks, etc.**—Reinforce all corners and angles with 18-in. strip. Build first ply on walls, lapping 6 in. out on floor. Build two-ply on floor, lapping 6 in. up on wall. Build second ply on walls. Provide 9-in. flange on all pipes for flashing. Waterproofing shall turn over top of wall and across floor where necessary. Use third ply on pools in upper stories.

Note: Do not place tile directly on waterproofing membrane. There should be a minimum of 3 in. of concrete or 4 in. of brick between tile and waterproofing.

(9) **Showers**—Two-ply membrane waterproofing shall be installed continuous over entire surface of the shower stall floor, and shall extend up on sidewalls or curbing at least 6 in. In no case shall this distance be less than 3 in. above finished shower stall floor level. Waterproofing on walls shall be 1-ply carried to height shown.

Note: Tile can be applied over membrane in stalls only. In rooms handle as for swimming pools.

(10) **Foundations**—From grade, membrane waterproofing shall be carried down outside of walls, through at footings, across basement floor, under and around all pits and trenches, and under or up all columns, forming a complete, watertight envelope. Protect all waterproofing with 1-in. coat of cement mortar.

Where impossible to work outside of wall, build brick course against sheathing, apply waterproofing and cast wall against same.

Where waterproofing must be applied inside structural walls, cover same immediately with concrete designed to hold existing pressure.

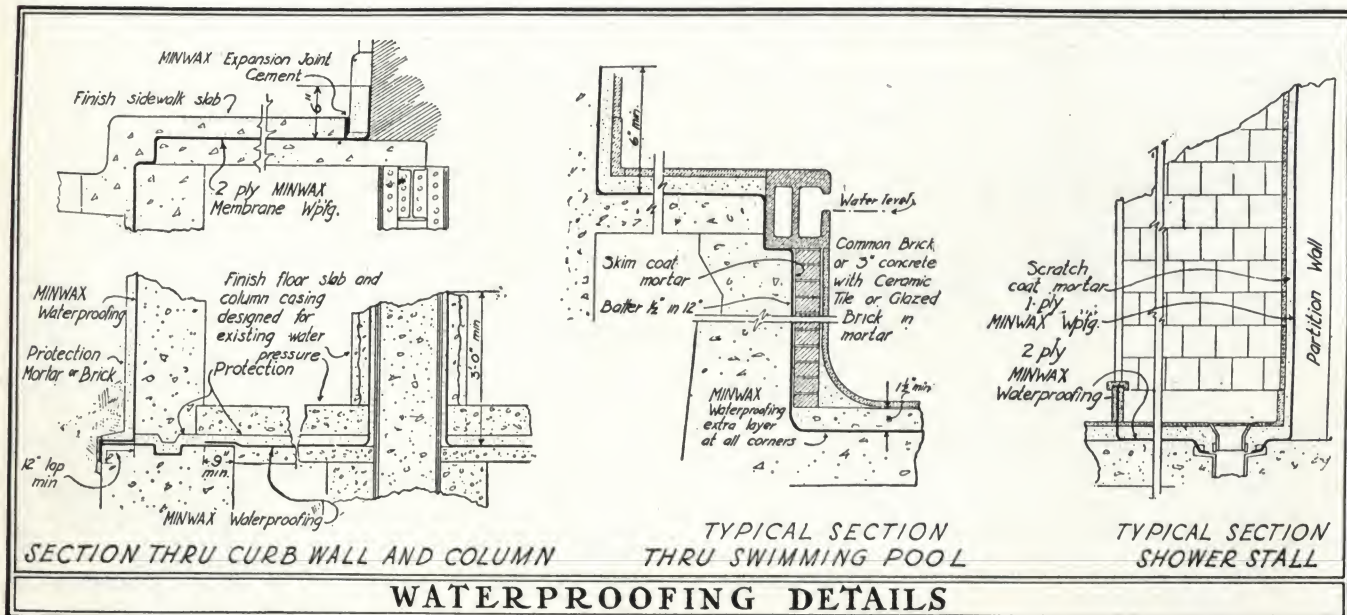

Provide pumping to remove all pressure and seepage, and keep surface dry during waterproofing and until concrete has set.

(11) **Quantities**—Use $12\frac{1}{2}$ yd. of fabric per ply and 4 to 5 gal. of asphalt per mopping for each 100 sq. ft. of surface.

(12) **Number of Plies**—Use a third ply on heads of over 15 ft. or under difficult working conditions.

Minwax Fibrous Brush Coat

(13) **For Dampproofing the Backs of Abutments, Retaining Walls, Foundations, etc.**—This material is applied cold (as delivered) with a long handled roofer's brush. It eliminates heating equipment cost, wastage, etc. It is a combination of Minwax Asphalts and special graded asbestos fiber. The asphalts penetrate the surface and a soft, sticky, fibrous skin is formed which closely approximates a full membrane system in efficiency.

This coating can not be chipped or flaked off, and backfilling handled in a normally careful manner will in no way cut or damage it.

(14) **Covering Capacity**—Approximately 100 sq. ft. per gallon per coat.

(15) **How Shipped**—In 5, 30 and 55 gal. containers.

(16) **Specification**—Walls shall be coated from grade to footing with 2 thorough applications of Minwax Fibrous Brush Coat, allowing 12 hours to elapse between coats. Materials shall be applied cold, without adulteration, with a long handled roofer's brush and well brushed into all surfaces, leaving no voids. Backfill in not less than 12 hours, exercising care to prevent damage of surface. Material shall be thoroughly stirred before and during application.

Note: It is important to provide subsoil drainage to carry off water and prevent development of hydrostatic pressures.

Special Asphalt Fillers for Sidewalk Lights, Grooves, Expansion Joints, etc.; Putties and Caulking Compounds

(17) **Minwax Vault Light Cement**—An asphaltic cement for sidewalk or vault light joints and other horizontal grooves and joints as in promenade decks, etc. It develops a strong watertight bond to concrete, stone or metal and its reliability has made it a standard in the trade. It will not "stew" under sun action or become brittle in cold weather. Use only in joints and grooves that are nearly level. Prime the joints with Minwax Asphalt Primer, heat the Minwax Vault Light Cement and pour it into the joints.

(18) **Minwax Fibrous Expansion Joint Cement**—For expansion joints in waterproofing membrane or joints where there is considerable movement. Prime the joints with Minwax Asphalt Primer, heat the fibrous expansion joint cement and pour it into the joints.

How Shipped—Both Minwax Vault Light and Fibrous Expansion Joint Cement are shipped in 1, 5 and 25-gal. containers (231 cu. in. per gal.)

(19) **Minwax Caulking Rope**—A moulded, fibrous, asphaltic rope for vertical joints, grommets, etc. Made in $\frac{3}{16}$, $\frac{5}{16}$ and $\frac{7}{16}$ -in. sizes. Shipped as desired.

(20) **Minwax Fibrous Mastic No. 1**—A black fibrous asphaltic putty compounded of Minwax Asphalts and asbestos fiber for caulking around windows. Will not harden or become brittle. Applied cold as received, this material is of proper consistency for use in hand caulking gun.

Covering Capacity—One gallon will fill 45 to 70 ft. of $\frac{1}{2}$ -in. joint.

(21) **Minwax Fibrous Mastic No. 2**—A stiffer grade asphaltic putty for application with trowel. Especially valuable for damp courses and for making tight joint between concrete and brick or for shrinkage joints in concrete. It will bond firmly to fresh concrete or mortar.

Covering Capacity—One gallon spreads over 10 to 14 sq. ft., $\frac{1}{8}$ in. thick.

How Shipped—Minwax Fibrous Mastics shipped in 1, 5, 30 and 55-gal. containers.

(22) **Minwax Caulking Compounds (Gray)**—A special elastic non-staining composition that never becomes hard and adheres strongly to all materials. Made in standard gray, special colors extra. First coat the sides of joint with Minwax Caulking Primer when filling joints in stone or wood. Used also for glazing in steel or wood sash. Made in consistencies for trowel and for hand gun.

How Shipped—1, 5, 25, 100, 500 and 800-lb. containers.

Specifications—

(23) **Wood Windows, Doors, etc.**—Pack space to within $\frac{3}{4}$ in. of face with oakum and fill solidly with Minwax Fibrous Mastic No. 1, forced in with hand caulking gun. Replace staff bead, or finish to smooth triangular bead.

(24) **Steel Windows**—For new work butter inside edge of masonry opening or surfaces of sash to be embedded, with thin coat of Minwax Fibrous Mastic No. 2. Caulk finished job or

old work around head, jamb and sill carefully with Minwax Fibrous Mastic No. 2, finishing to neat bead.

(25) **Waterproof Cut-off for Damp Courses, Window Sills and Heads, Parapets, Footings, Joints, etc.**—Prime surface with Minwax Asphalt Primer and trowel on good heavy coat of Minwax Fibrous Mastic No. 2. Set masonry, sill or coping. For severe exposures use fabric reinforcing as recommended in paragraph 26. Caulk coping joints with Minwax Fibrous Mastic No. 2 or Minwax Caulking Compound (Gray).

(26) **Spandrel Waterproofing**—Apply 2 good trowel coats of Minwax Fibrous Mastic No. 2 reinforced with 1 layer of Minwax Cotton Cord Cloth, extending from within 1 in. of face of wall at base of beam, up face and across top of beam, under back-up tile, turning up 4 in. or connecting with inside dampproofing.

(27) **Pointing Stone, Terra Cotta, etc.**—Rake out all joints for elastic pointing $\frac{3}{4}$ in. deep. Paint sides thoroughly with Minwax Caulking Primer, and fill with Minwax Caulking Compound, color to match or as selected. Horizontal joints in copings, cornices, sills, etc. especially important.

Minwax Bituloid for Protecting Metal, Wood or Concrete Against Acids, Alkali, Water, Brine and Corrosive Gases (Emulsified Asphalt)

(28) Minwax Bituloid consists essentially of fine asphalt particles suspended in water and has the same protective value as a hot mopped-on coating of acidproof asphalt without the difficulty and expense of the latter. Minwax Bituloid adheres perfectly to damp surfaces. Applied cold with brush or spray, it reaches cracks and corners apt to be overlooked in mopping. Made plain and fibrous for brush or trowel application.

(29) In addition to its use as dampproofing, Bituloid can be mixed with sand and cement for flooring or floor patching and is especially valuable for cork protection in refrigeration work.

Covering Capacity—Average 80 sq. ft. per gal. per coat.

How Shipped—In 1, 5, 30 and 50-gal. containers.

(30) **Specifications**—All surfaces to be coated shall be free from oil and loose scale. No coating work shall be carried on at a temperature below 40° F.

Apply 2 generous coats of Minwax Bituloid, flowing it on with a soft, long bristle brush, or use a spray. Allow first coat to become touchdry before proceeding with the second coat. Material shall be applied in consistency as received, first stirring it thoroughly.

Minwax Transparent Waterproofings for Waterproofing, Frostproofing, Stainproofing and Preserving Concrete, Brick, Stucco and Stone

(31) There are three types of Minwax Transparent Waterproofings: Minwax Clear Waterproofing for concrete, stucco, stone and brick surfaces; Minwax Heavy Clear Waterproofing for especially porous brick, stucco or concrete and for surfaces subject to immersion; Minwax Colorless Waterproofing for limestone, artificial stone, cream faced brick and other light colored surfaces. These three types are necessary to most efficiently meet the wide variety of conditions and materials for which a penetrative surface waterproofing is required.

(32) **Advantages**—All Minwax Transparent Waterproofings are liquids applied as received with a brush or spray. Ease of application assures positive effective results regardless of the character of the surface. When applied they penetrate into and below the surface for a considerable depth, sealing all pores and making the material waterproof. There is, therefore, nothing to be worn off, broken through or to scale loose; the waterproofing is really inside the surface. Minwax Transparent Waterproofings are applied as the final application, protecting the finished job, sealing craze checks and porous spots. They are independent, positive insurance against moisture penetration. Their waterproofing value is highly permanent, the result of the mineral wax base, and is proven by 21 years' service and test.

How Shipped—All Minwax Transparent Waterproofings are shipped in 1 and 5-gal. cans, 30 and 55-gal. drums.

(33) **Minwax Clear Waterproofing**—For concrete, stucco, stone and brick surfaces. A light amber-colored liquid which, when applied, penetrates deeply into the surface and cures, depositing a tough mineral gum which, in two applications, will completely

fill and seal the surface. Its action is purely physical or mechanical rather than chemical and is absolutely positive and independent of the nature of the surface to be waterproofed. It does not form any film or deposit on the surface or change the texture in any way. It changes the color slightly, which change decreases in time.

Covering Capacity—200 to 250 sq. ft. per gal. per coat on concrete and stucco. 150 to 200 sq. ft. per gal. per coat on brick.

(34) **Specification—General**—Surfaces shall be thoroughly dry, clean, sound and carefully pointed. No work shall be done at temperatures below 50° F. Brush dirt and dust off surface and apply 2 thorough coats with a brush or air spray, saturating and working the material into every part of the surface at each coat. Waterproofers shall do further incidental pointing, rubbing Minwax Pointing Paste into small cracks or holes immediately after application of first coat. Allow 24 hours between coats.

(35) **Wall Waterproofing**—All exposed surfaces must be waterproofed from roof flashing over and including coping and down outside surface to grade. Test all brick joints and repoint as necessary, repairing or replacing loose stucco or concrete. Test and carefully recaulk all window and door frames. (See Minwax Caulking Compounds.) Apply 2 coats as above specified.

(36) **Preventing Efflorescence**—Wall must be allowed to become absolutely thoroughly dry, work should only be undertaken under most favorable conditions. Clean off efflorescence with wire brush or dilute muriatic acid solution. When surface is thoroughly dry proceed as above for wall waterproofing.

(37) **Minwax Heavy Clear Waterproofing**—For especially porous brick, stucco or concrete and for surfaces subject to immersion. This material is heavier grade having a larger percentage of mineral wax and is applied and functions in the same way as Minwax Clear Waterproofing.

Covering Capacity—Same as for Minwax Clear Waterproofing.

Specifications—The same as for Minwax Clear Waterproofing.

Special Note: No work shall be done at temperatures below 60° F.

(38) **Minwax Colorless Waterproofing**—For limestone, artificial stone, cream colored face brick and light colored surfaces. This material, developed from Minwax Clear Waterproofing, deposits a superrefined mineral wax supplemented by certain preservative water-repellent chemicals and causes absolutely no change in color even on the lightest surfaces.

(39) On cut stone, Minwax Colorless Waterproofing performs four important functions: (1) Applied in 1 coat at the mill it protects the surface of the semicured stone from the absorption of dirt and stain while in transit and prior to setting. (2) Applied as a back coating it prevents the penetration of moisture from concrete or brick from discoloring the stone. (3) In the completed job it waterproofs the exposed surface so as to prevent the accumulation of grime and stain and assists in keeping the building in a light clean condition. (4) It prevents water and frost action and serves as a protective preservative treatment against disintegration and weather.

Covering Capacity—200 to 300 sq. ft. per gal. per coat.

(40) **Specifications—General**—Same as for Minwax Clear Waterproofing except that this material can be satisfactorily applied at temperatures down to 35° F.

(41) **Cut Stone (new)**—All stone shall be absolutely clean and dry before application of the waterproofing. The face and back of all stones shall be given 1 saturating coat of Minwax Colorless Waterproofing carried over 1 in. from each face on the "beds" and "builds." After erection and cleaning and when dry, all exposed surfaces shall receive the second thorough saturating coat of Minwax Colorless Waterproofing. Special attention shall be paid to horizontal and projecting surfaces as at cornices, copings, etc.

(42) **Existing Stone Work**—Surfaces shall be cleaned down by washing with soap and water or sandblasting and shall receive 2 thorough saturating coats of Minwax Colorless Waterproofing applied with a brush or spray 12 hours between coats.

Minwax Brick and Cement Coating for Waterproofing and Decorating Exposed Surfaces of Cast Concrete, Brick or Stucco

(43) This Minwax product is a pigment coating produced in a series of attractive flat color tones. It is a combination of the highest grade inert mineral pigments obtainable in a carrying vehicle based on Minwax Clear Waterproofing (one of the oldest, best known and most efficient mediums for exposed wall waterproofing).

This vehicle not only binds the coating on the wall surface so that it stays put, but it penetrates and eliminates the porosity factor and thus prevents the possibility of a dusty, loose coating.

It is not saponifiable and will not burn or peel from alkali action. The coating penetrates and becomes part of the concrete or brick, and the Minwax Clear Waterproofing vehicle penetrates well below the surface and permanently waterproofs it.

The effect produced is flat, without a painty sheen. It changes the texture of concrete or stucco but slightly and maintains the tone of the structural material and gives it the fresh, clean, uniform color selected. On masonry and brick, it gives a whitewash effect.

Applied with a brush or spray. Handles with unusual ease. Covers rapidly and effectively.

(44) **Uses**—Because Minwax Brick and Cement Coating is primarily a waterproofing, it is a very efficient means of decorating and beautifying concrete, brick or stucco and of preserving them from the disintegrating effects of water and frost.

Recommended also as a coating for light courts where a durable, fadeproof, white surface is desired.

(45) **Colors**—Finished in 11 standard colors: white, cream, yellow, cement gray, limestone gray, caen stone, green, brownstone, terra cotta, water blue and brick red. Special colors extra.

Covering Capacity—Varies between 160 and 250 sq. ft. per gal. per coat, depending upon the roughness and porosity of the surfaces to be treated.

How Shipped—In 1, 5, 30 and 55-gal. containers.

(46) **Specifications**—All exposed surfaces as directed shall receive 2 thorough coats of Minwax Brick and Cement Coating, color as selected. These surfaces shall be thoroughly dry, clean and sound, and shall be subject to the approval of painter before work proceeds. They shall be brushed to remove dust immediately before application of first coat. No work shall be carried on at temperatures below 45° F. The first coat shall be thinned with Minwax Brick and Cement Thinner according to the porosity of the surface. (Average conditions require from 10% to 20%). Painters shall do incidental pointing of open cracks or joints rubbing them full of Minwax Pointing Paste immediately after first coat is applied, brushing surplus from edges of crack and retouching to uniform appearance. When dry retouch light spots in surface with first coat mixture. After 48 hours apply second coat using material as received.

Note: It is especially important that parapets and horizontal surfaces should be done with greatest care. For dampproofing work all exposed surfaces from roof flashing to ground must be coated as per paragraph 35.

(47) Newly laid brick walls or new cast concrete surfaces shall receive 1 saturating coat of Minwax Neutralizer (see paragraph 49) to be followed when thoroughly dry by the first coat of Minwax Brick and Cement Coating.

(48) On old work, a sound solid surface must be obtained to get satisfactory service from coating. Wire brush surface thoroughly and repair and repoint all loose mortar or concrete. Use Minwax Pointing Paste (see paragraph 50) for filling small cracks and holes.

(49) **Minwax Neutralizer**—This is a water solution and a chemical which preages the concrete surface, reducing alkali activities and assuring maximum coverage and effectiveness from Minwax Brick and Cement Coating. Recommended for all new work.

Covering Capacity—150 sq. ft. per gal. One saturating coat required.

How Shipped—1, 5, 30 and 50-gal. containers.

(50) **Minwax Pointing Paste**—A special putty for filling small cracks and holes in stucco, concrete or brick work. Rub in crack and remove surplus from edges with stiff brush. Can be mixed with portland cement to stiffen.

Colors—The same as Minwax Brick and Cement Coating.

How Shipped—½, 1 and 5-gal. cans.

Minwax Plasterbond Dampproofing

(51) Applied in 2 good brush or spray coats to inside of wall beneath the plaster finish. It cures tacky and remains pliable and elastic indefinitely. It forms a tough, rubberlike, absolutely impervious, waterproof and dampproof skin that bonds securely to wall and plaster. It eliminates furring and prevents staining.

Covering Capacity—80 to 125 sq. ft. per gal. per coat.

How Shipped—In 5, 30 and 55-gal. containers.

Note: Not recommended for concrete ceilings or conditions where the weight of the plaster may be largely suspended on the coating.

Minwax Concrete and Terrazzo Floor Finish for Concrete, Terrazzo, Tile and Composition Floors

(52) Minwax Concrete and Terrazzo Floor Finish

fills the pores in the surface and subsurface of concrete floors with a tough mineral gum. Applied cold as a liquid after the floor has dried and cured, its action is mechanical and positive, creating an absolutely dense smooth surface. It thus eliminates the cause of dusting and disintegration and prevents the penetration of water, stains or liquids of any sort. The mineral gum is highly resistant to and gives maximum protection against the action of *brine, creamery and packing plant acids, or oils and dilute acids* found in industrial plants, and makes the floors highly *sanitary*. Floors subjected to heavy trucking have delivered years of service without needing retreatment.

On terrazzo and marble tile it brings out color, creates an easily cleaned sanitary surface and prevents dusting and staining. On composition and magnesite it prevents stains, kills salts and prevents disintegration by water.

Covering Capacity—Concrete and composition, 200 to 400 sq. ft. per gal. per coat; terrazzo, marble and tile, 400 to 600 sq. ft. per gal. per coat.

How Shipped—In 1, 5, 30 and 55 gal. containers.

Specifications—

(53) **Concrete, Magnesite, etc.**—Floors shall be clean and dry. For concrete and composition floors, apply 2 saturating coats with "T" head cotton floor mop leaving no puddles or excess material, allowing 12 hours to elapse between coats. Allow second coat to cure 24 hours before walking over floor.

(54) **Terrazzo, Tile, etc.**—Mop up surface with water to remove all dust and as soon as surface appears uniformly dry apply first coat of Minwax Concrete Floor Finish. Cross-mop first coat to even out and take up surplus. After 24 hours apply second coat in same manner. Very dense tile or terrazzo should be wiped up with dry rags 2 hours after each coat.

Specifications for Staining and Coloring Concrete Floors—

(55) The floors shall be clean, dry and absolutely free from dust and stain. Apply 1 thorough coat of Minwax Colored Concrete Floor Finish with a mop, cross-mopping the surface half hour after application to spread material uniformly. After 24 hours apply second coat in exactly the same manner, and about 2 hours after applying the second coat, wipe up the surface thoroughly with dry rags.

(56) Penetrating and permanent stain colors are added to Minwax Concrete and Terrazzo Floor Finish at the factory and the Minwax Colored Concrete Floor Finish delivered on the work ready for use. These stains bite well into the surface, giving a soft textured color that will resist even concentrated wear. It is especially valuable for integrally colored concrete and magnesite floors that show uneven appearance.

Colors—Made in tile red and linoleum brown.

Minwax Concrete Floor Binder

(57) This material is a heavier special grade developed from Minwax Concrete and Terrazzo Floor Finish and is designed for binding together the surface and subsurface particles of a granular, soft or sanding concrete floor. It will create a sound, durable surface.

It is not recommended for average sound concrete floors. On such surfaces Minwax Concrete Floor Finish should be specified and used.

(58) **Specifications**—Two thorough coats applied with long handled brush. First coat thinned 10% with turpentine.

Packages—Same as for Minwax Concrete Floor Finish.

Minwax Concrete Floor Paint

(59) A high quality long-lived durable floor enamel. Two coats recommended.

Standard Colors—Buff, light gray, dark gray and red.

Covering Capacity—500 sq. ft. per gal. per coat.

Minwax Flat Finish for Wood Floors and Trim

(60) For finishing, preserving and staining wood floors and trim. It is a combination of certain carefully blended oils and mineral waxes in the natural and carrying a series of clear stain colors.

Applied in saturating coats, it penetrates rapidly, filling the wood with a tough mineral gum. In its natural or clear color (without stain) it does not darken the wood, but by waterproofing and stainproofing, insures the permanence of the clean, fresh surface.

(61) **Effects**—In general, the effects produced are of the natural wood stained to the color selected and with a soft waxy sheen. A paste filler can be used where a closed, uniform surface is desired and where the wood is open grained.

(62) **Economical in First Cost and Maintenance**—Minwax Flat Finish offers important savings, not only in first cost, but in cost of maintenance. It accomplishes results in 2 easily applied coats, reducing the cost per square foot or finished woodwork to the minimum.

It is non-fading and sunfast, highly water-repellant and water-resistant, and will give unusual service on exterior trim exposed to the weather. Under all conditions maintenance is startlingly simple—a cloth dampened with Minwax Flat Finish and used to wipe down the surface will brighten and renew the finish without showing patches or laps, and, periodically used, will maintain permanently and enhance and enrich the beauty of the finish.

Colors—Minwax Flat Finish is made in the following stain colors: No. 9 (natural); No. 11 (light oak); No. 12 (dark oak); No. 13 (walnut); No. 716 (dark walnut); No. 750 (Jacobean); No. 15 (mission green); No. 16 (mahogany).

How Shipped—Shipped in 1, 5, 30 and 55-gal. containers.

(63) **Specifications—Trim**—Wood shall be clean, dry and carefully sanded and shall be stained and finished with 2 coats of Minwax Flat Finish applied with a brush and in color as selected. Each coat shall be wiped with rags in 2 to 6 hours to remove surplus. Allow 12 hours between coats. Do not apply at temperatures below 55° F.

(64) **Floors**—Wood shall be clean and dry and shall be carefully scraped or sanded with the grain (all old finish, varnish, shellac or wax shall be removed). Apply 2 coats Minwax Flat Finish, color as selected, as directed for trim. Protect and, on completion of building, clean floors and apply polish with weighted brush or electric polisher. For high polish apply Minwax Finishing Wax before polishing.

(65) **Maple Floors—Partial Penetration**—Apply 2 thorough saturating coats of Minwax Flat Finish No. 9 in accordance with above directions, using special care to remove all surplus after each coat. Close off the floors and protect them against traffic for at least 3 days to permit perfect curing of the materials. Then cover the floor with paper or clean sawdust until ready for final occupancy.

Note: The stain colors are not recommended for maple floors.

(66) **Minwax Penetrating Finish**—Will penetrate the full thickness of 1-in. flooring, sealing and filling the surface and protecting the whole body of the wood, will retard dry rot, warping, swelling, etc. Curing to a tough gum, it binds the surface fibers with tough wear-resisting material.

(67) **Complete Penetration**—Apply 1 thorough even coat of Minwax Penetrating Finish with a brush using 1 gal. for each 350 sq. ft., working it well into the wood. Wipe up the surface thoroughly with clean cloths in not less than 12 nor more than 24 hours after application to remove any excess material. Close off the floor from traffic for from 1 week to 10 days before placing same in service. If necessary, floors can be washed with soap and cold water after thoroughly cured.

Minwax Acid Stains

(68) True fuming water stains that develop and burn the color on and into the surface of the wood. Produced in three tones: No. 120, light fume; No. 122, Flemish; No. 123, dark Flemish.

Shipped—In ½, 1 and 5-gal. glass containers.

Covering Capacity—Approximately 300 sq. ft. per gal.

Specification—Apply Minwax Acid Stain with a brush or sponge as conditions require. Sand lightly where dry and apply Minwax Flat Finish, color to be selected. Colored fillers should be added to No. 9 Flat Finish and wiped off ½ to 1 hour after applying.

Minwax Finishing Wax

(69) A special hard drying wax to be applied over Minwax Flat Finish where a high wax luster is desired. As already noted, open grained wood can be filled before waxing. Apply with a cloth and polish with a weighted brush.

Packed in 1, 3½ and 7-lb. containers.

MITCHELL-RAND DAMPPROOFING CORP.

Manufacturers of M-R Protective Coatings

15 Vesey Street
NEW YORK, N. Y.

Products

DAMPPROOFING (Interior):

- M-R FURRING COMPOUND.
- M-R SEMI-MASTIC.
- M-R DAMPPROOFING MASTIC.
- M-R STONE BACKING COMPOUND.

INTEGRAL WATERPROOFING:

- M-R DOUBLE STRENGTH WATERPROOFING PASTE.
- M-R LIQUID WATERPROOFING.

EXTERIOR WATERPROOFING (above Grade):

- M-R COLORLESS WATERPROOFING.
- M-R BRICK and CEMENT COATING in colors.
- M-R SUPERIOR CEMENT COLORS.

M-R SHIELD BRAND CONCRETE FLOOR WAX.

Also M-R Anti Freezing, Liquid and Cement Accelerator, M-R Caulking Cement, M-R Roofing Cement, M-R Fibre Roof Coating, M-R Black Asphalt Paint, M-R Expansion Joint Asphalt and Gilsonite, Waxes and Asphalts.

Experience

In 1902 we started the manufacture of dampproofing compounds under formulae developed by L. F. Rand, Chemist, and many of the largest buildings throughout the country, representing all classes of structural work, are references to the quality and durability of these products. Twenty-five years of exhaustive research and extensive experiments have produced a line of waterproofing and dampproofing compounds that makes the trademark "M-R" synonymous with first quality.

Our contracting department, in charge of experienced men, will estimate on furnishing and applying M-R Furring Compound, M-R Semi-Mastic, M-R Dampproofing Mastic, M-R Colorless Waterproofing and M-R Cement and Stucco Coating; also on pointing up brickwork, waterproofing exterior brick, stone or stucco buildings, and the calking of window and door frames. Only expert mechanics are employed in each special line.

We manufacture the compounds. We do the work.

Experience proves that the only satisfactory way to dampproof is by the use of an asphalt-gilsonite mixture, applied in sufficient quantity.

M-R Furring Compound

This is a black, elastic, waterproof material, and specified extensively by prominent architects and builders. It is applied by means of a brush to the interior of outside walls above the grade level prior to the application of plaster. This compound prevents the penetration of dampness, and renders the inside of walls verminproof and stainproof.

M-R Furring Compound is recommended for use, also, on terra cotta ceilings and furring to prevent plaster from staining; it bonds perfectly with plaster.

The material can be employed with equal effectiveness for rough concrete surfaces, but should not be used on smooth concrete, to which portland cement mortar or plaster is to be directly applied.

The approximate covering capacity of M-R Furring Compound is 60 sq. ft. per gal., 1 coat. It is shipped in barrels, half-barrels and 5-gal. containers.

Typical Specifications—Preparation of Surfaces—Point up all voids and breaks in masonry surfaces specified to be dampproof. Patch defective brickwork at ceiling due to cen-

tering. Treat similarly the angle of wall and ceiling with cement or lime mortar to form a continuous surface.

Application—The interior surfaces of exterior exposed walls to be plastered, are to receive 2 coats of M-R Furring Compound, and in accordance with directions of the manufacturer, the Mitchell-Rand Mfg. Co. M-R shall be applied between floor level and ceiling below. Where the arches are placed prior to this application, the coating shall be carried back 12 in. from the outer walls on the underside of the connecting ceiling.

Cut-outs, wall chases, etc., shall be coated thoroughly before pipes, or other work is installed.

M-R Semi-Mastic

Recommended for use on hollow back-up tile walls, where there are deep corrugations in the tile.

Made of high grade asphaltic gums interlaced with asbestos fiber. Has a soft consistency which enables it to be easily applied with heavy roof brushes.

An application gives a coating many times heavier than ordinary dampproof paint.

In one day a man can apply, approximately, one 50-gal. barrel. Packed in 50-gal. barrels, half-barrels and 5-gal. pails.

Specifications—The work included consists of dampproofing of all exterior walls above grade.

All surfaces shall be dry and free from dirt and foreign matter. All vertical and horizontal mortar joints are to be pointed up by the mason contractor to the satisfaction of the dampproofing contractor.

The Semi-Mastic is to be applied with a brush, in 2 coats and shall be returned on the reveals of openings, carried around the column castings and concrete beams adjoining such surfaces in and around all chases, recesses and cut-outs and extend 12 in. on the adjoining concrete slabs.

The material shall be M-R Semi-Mastic. One gallon is to cover not more than 30 sq. ft. and the dampproofing contractor is to state in his estimate the number of 50-gal. barrels of dampproofing material he agrees to use on this job. This is to be checked by general contractor and verified by architect.

M-R Dampproofing Mastic

A black, plastic, waterproof compound, containing only the best ingredients and blended under a scientific process. It is applied with a trowel, similar to cement or any other plastic substance, and is ready for immediate service as received in original packages; no heating or thinning necessary.

Used extensively on the interior of outside walls instead of dampproof paint. It bonds perfectly with plaster, absolutely prevents the penetration of dampness, and makes the inside of walls verminproof and stainproof. Furring and lathing are unnecessary when this material is used.

The approximate covering capacity is 20 sq. ft. per gal. on brickwork. It weighs about 10 lb. per gal., and is shipped in barrels, half-barrels and 5-gal. containers.

Typical Specifications—Preparation of Surface—Point up all voids and breaks in masonry surfaces specified to be dampproof. Patch defective brickwork at ceiling due to centering. Treat similarly the angle of wall and ceiling with cement or lime mortar to form a continuous surface.

Application—The interior surfaces of exterior exposed walls to be plastered, are to receive 1 troweled coat of M-R Dampproofing Mastic, and in accordance with directions of the manufacturer, the Mitchell-Rand Mfg. Co. M-R Waterproof Plastic shall be applied between floor level and ceiling below. Where the arches are placed prior to this application, the coating shall be carried back 12 in. from the outer walls on the underside of the connecting ceiling.

Cut-outs, wall chases, etc., shall be coated thoroughly before pipes, or other work is installed.

Dampproofing Spandrel Beams—A most effective method is the M-R System using M-R Mastic as described in the following specifications:

Scope of Work—The work included in these specifications and shown on the drawings consists of the dampproofing of the spandrel beams, excepting such work as may be specifically excluded.

Standard M-R Method of Dampproofing the Spandrel

and extend back on the floor 2 in. beyond the line of the inside wall.

(b) A layer of 1-ply Barrett's Black Diamond Roofing Felt.

(c) A protective coat of M-R Dampproofing Mastic, applied to the upper surface of the felt.

The foregoing to constitute a 3-course job.

Material—Shall be M-R Dampproofing Mastic made by the Mitchell-Rand Mfg. Co., 15 Vesey Street, New York City.

Material is to be used from original package, as delivered from the Mitchell-Rand factory, without thinning or adulteration. One gallon is to cover not more than 12 sq. ft. and the dampproofing contractor is to state in his estimate the number of 50-gal. barrels of dampproofing material he agrees to use on this job.

It shall be the duty of the general contractor to record both the number of barrels delivered and used; he shall transmit these figures to the architect for verification with the contract.

M-R Stone Backing Compound

A black, alkaliproof and waterproof paint that protects granite, limestone, Bedford stone, marble or any other cut stone from chemical action and discoloration due to alkali in cement. One gallon applied by means of a 4 or 6-in. flat varnish brush will cover approximately 125 sq. ft. Packed in barrels, half barrels and 5-gal. pails.

Specifications—All surfaces in contact with masonry (the top, bed, sides, and back) are to be thoroughly coated to within 1 in. of the face to prevent staining. The surface of the stone should be dry and clean to insure adhesion; the coating should be continuous, even, and all Lewis holes, anchors, and recesses should be coated. After the cut stone is set it is advisable to apply an additional coat on the back.

M-R Colorless Compound

A colorless liquid for dampproofing the outside face of brick walls where it is undesirable to use a paint on account of such material changing the texture or color of the bricks.

Shipped in barrels, half-barrels, 5-gal. containers, and 1-gal. cans.

Specifications—Preparation of Surfaces—Point up all walls wherever necessary, and fill all spaces and voids around window frames and other openings. Walls shall be perfectly dry and surfaces free from foreign matter.

Application—All walls, sills and lintels shall be treated with 2 coats of M-R Colorless Compound, and in accordance with the directions of the manufacturer, the Mitchell-Rand Mfg. Co. The coats shall be applied on successive days, viz., one coat shall be applied when the surfaces are perfectly dry, as noted, and the other coat given the next day.

M-R Brick and Cement Coating

Made in standard colors and white. Used to waterproof and beautify surfaces of concrete, stucco, brick and plaster, both interior and exterior. It prevents hair-cracking and is absolutely waterproof.

Application—All surfaces shall be dry and free from dirt and foreign matter.

The general contractor shall leave the surfaces to be dampproofed troweled smooth; all voids shall be filled with cement mortar, leaving a slight bevel, not to exceed $\frac{1}{4}$ in. to the foot, sloping towards the outside of the building.

The work of dampproofing shall be performed in accordance with the "M-R System of Dampproofing Spandrel Beams," i.e.:

(a) A coat of M-R Dampproofing Mastic, troweled $\frac{1}{8}$ in. thick, shall be applied 2 in. inside the line of outside face brick

Applied in same manner as ordinary paint. Due to its unique film structure, the dampness always present in cement and brick cannot cause it to peel and in this regard it is quite unlike oil paint.

It does not alter the texture of the surface to which it is applied. It dries to a soft, artistic, flat or mat finish which is an integral part of the surface itself, and it may be scrubbed and washed without injuring the film.

Specifications—Loose particles are to be thoroughly cleaned off the surface with a wire brush, and any appearance of salts removed with a solution of muriatic acid and water (1 part to 10) before the coating is applied.

Apply 2 coats of M-R Brick and Cement Coating, of selected color, with a full, wide, clean brush—brushing to settle it into place, only, and not for the purpose of extending it. Allow 24 to 48 hours between coats.

First coat may be thinned with 1 pt. of turpentine to the gallon. Second coat to be applied as received in the original package.

M-R Double Strength Waterproofing Paste

This is an integral waterproofing compound, used for making concrete, cement, mortar and stucco waterproof. It is very effective and in wide use.

It is a smooth plastic material. When used, it is first dissolved in the gauging water, which insures an even and uniform distribution throughout the mass. This method is decidedly economical, and makes possible the solution of different waterproofing problems; it is also very useful in connection with the repairs of a completed structure, as the operation is carried on entirely from the inside.

The material is shipped in barrels, half-barrels, 5-gal. containers, and 1-gal. cans.

Specifications—One gallon of M-R Waterproofing Paste dissolved in 35 gal. of water will waterproof 1 cu. yd. of concrete; 1 gal. of M-R Waterproofing Paste dissolved in 17 gal. of water will waterproof 100 sq. ft. of cement-finish floor, wall or stucco 1 in. thick; 1 gal. of M-R Waterproofing Paste dissolved in 35 gal. of water will waterproof 1 cu. yd. of dry cement and sand for laying up brick or stone walls.

M-R Liquid Waterproofing

This is a liquid with a calcium base, and is used in the gauging water for making concrete, cement mortar and stucco waterproof. It is also used for cement floors where a dense hard non-dusting waterproof finish is desired. Packed in 50-gal. barrels, half-barrels, and 5-gal. pails.

Specifications—M-R Liquid Waterproofing is mixed in the proportions of 1 gal. to 35 gal. of water. This gauging water is used to wet the aggregates in the usual way.

M-R Superior Cement Colors

These are imported iron oxide colors and are non-fading. In pulp or dry. They tend to retard excessive moisture absorption, even to the extent of making the concrete slightly waterproof. They are not susceptible to the action of cement alkalis. They are *all color*, neither lime or any other filler is added. Being unadulterated, *less* is required. As their name implies, they are superior in brilliancy and strength as many tests prove. They consist largely of metallic and mineral oxides, the small percentage of other color material being of such a nature that it has no injurious effect on the bond, cohesive ultimate and tensile strengths of concrete.

M-R Shield Brand Concrete Floor Wax

A high grade wax for treating and polishing old and new concrete floors. Readily cleaned. Gives high luster.

NATIONAL WATERPROOFING CO.

Waterproofing Engineers and Contractors

1077-1081 Columbus Avenue
BOSTON, MASS.

Products and Services

ENGINEERS and CONTRACTORS for WATERPROOFING, DAMPPROOFING and OILPROOFING.

KENNELLY'S LIQUID (INTEGRAL) WATERPROOFING and OILPROOFING for concrete.

KENNELLY'S DAMPPROOFING PAINT and COMPOUND.

KENNELLY'S CONCRETE FLOOR HARDENER.

General

We will absolutely guarantee all waterproofing done by us to be watertight. We will dampproof without discoloring the outside of any concrete, brick or stone structure and will guarantee the work to be absolutely moistureproof. We will apply a floor hardener to any concrete surface and guarantee the work against dusting or softening of the surface. All work done by us will be carried on in such a manner that no delay will be caused the general contractor or any part of the work.

Engineering Department

Our engineers are always at the service of architects, engineers, contractors and owners for the solution of waterproofing problems, for preparing specifications and for estimating the cost of waterproofing all concrete structures, foundations, tunnels, dams, reservoirs, swimming pools, etc.

Kennelly's Liquid Waterproofing (Integral Method)

Kennelly's liquid waterproofing is an integral waterproofing liquid which crystallizes in the mass as the cement sets, sealing completely and permanently the voids or pores between the sand and cement against the passage of liquids, even under heavy pressure. It is used in concrete or cement mortar to prevent the penetration of water or dampness. Having practically the same specific gravity as water, it immediately becomes part of the tempering water when poured into the barrel, thus becoming evenly distributed throughout the mass. Kennelly's liquid waterproofing not only renders concrete, mortar and stucco permanently impervious to water, but prevents discoloration and efflorescence, gives additional protection to the reinforcement and increases rather than decreases the strength of the mass. It does not affect the color or setting of cement mortars or concrete.

Kennelly's Plaster Waterproofing

If a watertight plaster finish is desired, put the compound into the water used in making mortar and then place the mortar on the surface to be covered and work it out to the desired finish. By this method, concrete, cement mortar and stucco are rendered permanently moistureproof and pressureproof, the finished surface is not discolored, and the strength of the concrete is increased rather than decreased.

Kennelly's Exterior Dampproofing (Colorless)

A colorless liquid for dampproofing exterior surfaces of stucco, brick, stone and concrete masonry. Also

extensively used as a sizing for lime plaster on interior walls before paint is applied. It is applied with a brush. Efflorescence and blotches are caused by the absorption of atmospheric moisture and exudation of gypsum and lime. By the use of our dampproofing, we have overcome these disfiguring features without discoloring the original surface or joints.

We will guarantee to make any building dampproof by this method at a reasonable cost.

Kennelly's Interior Dampproofing (Dark)

A compound for coating interior surfaces of brick, stone or hollow tile walls. Forms a continuous waterproof film or coating on the surface, completely sealing walls and preventing penetration of moisture. This method eliminates furring and lathing and thus effects a great saving, as the plaster may be applied directly to this coating.

Kennelly's Concrete Floor Hardener

A liquid compound either *mixed with the concrete* finish in new floors or *applied to the surface* of old as well as new floors. In buildings subject to heavy wear, the dusting of a concrete floor induces disintegration and crumbling of the concrete and thus ruins the floor. Our hardener insures against dusting, and provides a non-absorbent surface, more impervious to wear than ordinary concrete, makes a durable top surface, and provides a sure non-slip foothold.

Specifications

Integral Waterproofing and Oilproofing—To each 50 gals. of water (1 bbl.) used in tempering the mass concrete, add 6 qts. of Kennelly's Liquid Waterproofing, thoroughly mixing the concrete and carefully spading it into place so as to avoid stone pockets.

Plaster Waterproofing—Material used in same proportion as for integral work, mixing the waterproofing with water used in making concrete mortar and then placing the mortar on the surface to be covered, using 6 qts. of waterproofing to 50 gals. of water.

Dampproofing—Thoroughly clean surfaces to be dampproofed by washing with warm water. Allow to dry, and then apply dampproofing with brush, covering surface well. Allow 4 or 5 hours to elapse before making second application, and when thoroughly absorbed, make a third application.

Concrete Floor Hardener—First thoroughly clean the floor surface to be treated by scrubbing with warm water, thereby removing all foreign particles, etc. Allow to dry, and then apply the floor hardener with brush, covering the surface well and allow to dry for at least 4 or 5 hours before making a second application. Should any dry spots appear, treat with another coat of hardener.

BOSTON OFFICE: 950 Park Square Building—Telephone Hancock 0033

Services

Exterior Surfaces of Stone, Brick and Stucco Buildings, above grade, TREATED with the CAFFALL PROCESS, the Heat Method.

Business, Residential and Monumental Buildings and Churches Restored, Dampproofed and Preserved; Exteriors of Delicate Marble Preserved from Weather Disintegration; Monuments Restored and Preserved.

Guarantee

Work done under contract with a 10-year guarantee, or a cost-plus-percentage basis without guarantee.

Process

New Structures—The surface is tested and structural defects, if any, are made good. The wall is then impregnated to considerable depth with a melted wax compound forced in by heat.

Old Structures—Where masonry walls leak but material disintegration has not occurred all joints are tested and made sound where necessary, and the entire surface, including joints treated as above.

Where the surface has disintegrated from weather attack, it is restored to sound condition, joints are re-pointed, and the entire surface treated as above. The treatment leaves the appearance unchanged, and one treatment will last for the life of the building.

It will be understood that application of heat to buildings, particularly to fine marble and granite, requires expert skill. Heat dries out the surface and forces

penetration of preservative material. On cooling, the wax congeals and becomes an integral part of the material at and below the surface.

Plymouth Rock
Treated 1921

Durability

The principal components can not be easily oxidized and are insoluble in water, acidulated or alkaline solution, or gases. This is the only preservative process having a successful history covering any considerable period. Buildings treated more than fifty years ago are still dry.

Cost

Cost can be ascertained on application to the company. It is determined by the following elements:

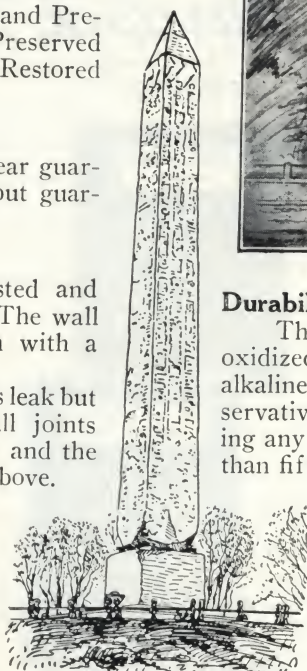

Character of material to be treated.

Condition, whether newly erected, old, or requiring renovation.

Area requiring treatment.

Character of surface, whether plain or ornamental.

Location of building or monument.

Obelisk or Cleopatra's Needle

Restored and preserved by Caffall Process, the heat method, in 1885

THE PAR-LOCK APPLIERS

Par-Lock for Plastering, Waterproofing, Dampproofing and Cork Insulation

PARENT COMPANY
THE PAR-LOCK COMPANY
CLEVELAND, OHIO

Products

PAR-LOCK, the method of mechanically applying waterproofing asphalt compounds; also the method of mechanically building out a coarse rock grit key when used for plastering purposes.

The Par-Lock Appliers have complete equipments in their possession. Their crews are made up of trained, experienced men.

Estimates will be furnished and contracts completed promptly.

Par-Lock Specifications

Below are listed the various forms of standardized Par-Lock specifications.

Par-Lock Plastering (No Scratch Coat Required)—Form "A"—Preparation for plastering horizontal concrete, concrete tile and tile surfaces, except roof slabs. On roof slabs, use specification "B."

Form "B"—Preparation of surfaces to be plastered. To supplant furring and to seal positively against air filtration and dampness. For use on concrete, brick or tile filled exterior wall surfaces and roof slabs. Also on vertical concrete and terra cotta and gypsum surfaces.

Floor Finish—Form "C"—Waterproofing and binding plastic floor finish except below grade line.

Waterproofing—Form "D"—For waterproofing surfaces to be finished with portland cement or tile and for bonding thin portland cement, and tile finish to structural bodies, laboratories, basements, swimming pools, tunnels, etc.

Form "E"—"Cotton membrane waterproofing" for heavy waterproofing on basement walls, floors, footings, swimming pools, tanks, etc.

Form "F"—For light waterproofing of footings, outside walls below grade line, basement floors, tunnels, etc.

Form "G"—"Membrane waterproofing" for heavy waterproofing to resist hydrostatic pressure (tunnels, swimming pools, reservoirs and deep basements).

Form "H"—For waterproofing bridge decks, basement floors, tunnels, etc.

Dampproofing—Form "I"—Dampproofing walls to be furred, and for coating cinder fill mixtures under matched flooring.

Form "J"—For dampproofing tile wall surfaces to be plastered. May be used where hand applied bond paints are specified, except on concrete and ceiling surfaces.

Form "K"—A gun applied built-up mastic for surface finishing, cork and other insulating materials. This specification may be built-up, airtight and dampproof or waterproof where required.

Note: If you do not have these specifications on file, they will be sent on request.

PITTSBURGH, PA., 1213 Chamber of Commerce Building
NEW YORK, N. Y., 40 East 34th Street

Missouri Corporation

KANSAS CITY, Mo., 407 Dwight Building
SAN FRANCISCO, CALIF., 625 Underwood Building

Services

Real WATERPROOFING can not be accomplished by haphazard methods. It is a specialized engineering problem, requiring study and wide experience with all materials and methods, used under all sorts of conditions.

It is with this in mind that we offer our services and solicit consideration wherever WATERPROOFING, DAMPPROOFING or PROTECTIVE WORK is required. Information or suggestions, based on our past experience, will be cheerfully given at all times. This applies to Basement Walls and Floors, Pits, Tanks, Swimming Pools, Cisterns, Tunnels, Subways, Concrete Bridges, Retaining Walls, Roundhouses, Piers, etc.

Material

The PERMANENT WATERPROOFING Co. adopts the material best adapted to the conditions which must be met.

Application

The waterproofing can be applied to either the *Inside* or *Outside* surfaces of walls after all forms are removed, and to the top of rough floor slabs and footings, in the form of brush coats or in combination of brush and plaster coats.

Appearance

The finished surfaces are left with a finish and color similar to cement brush coat or cement plaster. The surface in either case may be plastered or painted or finished with any type of cement, marble, or terrazzo surfacing.

Paint will not be discolored.

Resistance to Pressure

Applied either upon the inside or outside of walls, this waterproofing will resist any hydrostatic pressure which the wall is capable of withstanding.

Permanency

This material is not a simple coating, subject to injury by ordinary wear and abrasion or by changing atmospheric conditions. It will not "slump," crack or scale. It possesses much chemical vitality and in combination with water becomes very active. It works its way into the pores of the concrete, expands and unites chemically as well as mechanically with the structural materials, forming a strong and impenetrable mass.

The depth of the penetration varies in accordance with the porosity of the masonry—being greatest where the voids are most numerous and seepage most likely. The result is a surface which is part of the wall or slab and can not be removed without actual cutting. Not only does the material form a *permanent waterproofing*, but it also serves as a preservative and strengthener of the masonry.

Bonding Qualities

It is indispensable where a perfect bond between rough slabs or walls and finish coatings of cement, terrazzo, marble, tile, etc., is required.

Working Conditions

The efficiency of any material or methods depends in the last analysis upon workmanship.

The material is mixed with water, and the work can be done at a time when the working conditions are most favorable. This makes possible the highest class of workmanship when combined with the employment of intelligent experienced workmen, properly directed.

Outstanding Features

Waterproofing placed upon the *inside* or *outside* of wet walls, which penetrates and becomes part of the walls or floors.

Waterproofing which actually increases, rather than decreases, the strength and efficiency of the concrete, stone or brick.

Waterproofing which is continuous and assures (instead of breaks) the bond between footings and walls. This should be considered in case of lateral pressures.

Waterproofing which introduces no foreign or injurious materials into the concrete.

Waterproofing which assures bond between rough surfaces and finish and which is not injured by contact or vibration.

Waterproofing which eliminates the necessity for double or protective walls and slabs.

Waterproofing which offers peculiar resistive qualities to sulphurous fumes, gases, acids, fire and electrolysis.

Waterproofing which may readily be repaired in case of structural cracks.

Waterproofing which is *less expensive* than any other real waterproofing.

Waterproofing which is absolutely *guaranteed*.

Specifications

Walls—All outside walls and areas exposed to seepage shall be waterproofed by the PERMANENT WATERPROOFING Co.'s method on the inside surfaces from floor level to outside finished grade level. This work to be done before partitions or other obstructions are installed.

Inside walls and columns extending through the basement slab shall be waterproofed or dampproofed as may be required—upon both sides from the top of the footings to the outside finished grade level.

Floors—After the rough slab has been poured and sufficiently set it shall be thoroughly cleaned and waterproofed according to PERMANENT WATERPROOFING Co.'s method, and finished with a slush containing good sharp torpedo sand to give a good bond surface for the topping. This work shall be done before partition walls, machinery bases, conduits, etc., are placed.

Immediately before the topping is applied wash this surface well and apply a bonding coat of cement and Permanent Waterproofing and thoroughly brush into the slab. Apply finish in the usual way.

Disintegration Problems

The disintegration of concrete, brick and stone surfaces has been studied by us for a number of years. During that time we have handled a number of problems of this nature, and have also made a number of tests under field conditions. We would be pleased to furnish detailed information regarding them.

Product

MEDUSA WATERPROOFING, the standard of integral waterproofing quality for twenty years, in either Powder or Paste form—the original integral concrete waterproofing.

For Medusa Portland Cements, see pages A39-43; for Medusa Cement Paint, see page B1689.

Output

3,000,000 lbs. of waterproofing.

Packages

Medusa Waterproofing Powder is furnished in 40-lb. paper lined cloth sacks. A quart weighs one pound.

Medusa Waterproofing Paste is furnished in metal containers, with large friction seal tops, 1 gal. (8 lbs.) and 5 gals. (40 lbs.) each, packed for shipment in substantial crates of six 1-gal. or two 5-gal. cans each. A pint weighs 1 lb.

Literature

New Medusa literature, in standard size 8½x11 in., describing many uses for Medusa Waterproofing Powder and Paste, will be sent on request.

Uses

Medusa will give positive waterproof and damp-proof results in construction of concrete reservoirs, water towers and tanks, swimming pools, tunnels, disposal plants, pumping stations, elevator pits, stucco, basement walls and floors, cisterns, cement blocks, cast stone, etc.

Medusa Waterproofing Comes in Two Forms

Medusa Waterproofing Powder—Medusa Waterproofing Powder is white, finely ground and highly water-repellent. When mixed with any reliable brand of plain portland cement, in proper proportions, it is uniformly distributed through the concrete, being entrapped or held in place by the cement, sand and aggregate. Due to its water-repellent nature, it prevents the absorption or percolation of water, ground or drainage water, spring water, dampness or moisture from the earth or atmosphere.

For every bag of portland cement used, mix 2%, or 2 lbs., of Medusa Waterproofing Powder if you want absolutely waterproof concrete.

Medusa Waterproofing Powder is furnished in 40-lb. paper lined cloth sacks, enough to mix with and thoroughly waterproof, 20 bags of portland cement.

Medusa Waterproofing Paste—Medusa Waterproofing Paste contains the same percentage of water-repellency as Medusa Waterproofing Powder. Its effect on the concrete mass is exactly the same as that of Medusa Waterproofing Powder. It is a heavy paste, to be dissolved in the gauging water used to mix the concrete.

TRADE-MARK

Two per cent of Medusa Waterproofing Paste by weight of the cement, or 2 lbs. per sack, is the correct proportion to render concrete and cement work permanently waterproof.

Integral Method of Waterproofing

Since the earliest days of the manufacture of portland cement in this country, the need for preventing the absorption of water by concrete has been fully recognized. Concrete contains many microscopic pores or capillary tubes constituting from 20% to 40% of the cubic contents. Water enters concrete because of the physical law of capillary attraction and its natural absorptive qualities. To make it waterproof, the absorptive properties must be destroyed.

Medusa Waterproofing becomes an inseparable part of the concrete itself. Designed to be mixed with concrete, to lubricate the particles and form an integral part of the mixture, it thus becomes an inseparable part of the mass, being tightly sealed within the concrete.

Medusa Waterproofing will positively and permanently render concrete dampproof and waterproof. The integral method of waterproofing is economical, it does not require additional excavation on the exterior of basement or foundation walls, it does not require additional brick or concrete protecting walls, no difficulty experienced in making joints around pipes and at the bottom of outside walls, at footings, at junction of the basement floors and footings, and wherever horizontal or vertical joints occur. Blind leaks are not possible in integral waterproofing. Leaks due to settlement cracks can be economically repaired.

Waterproofed Cement Plaster Coat Method

This is a permanent and inexpensive method of rendering a completed concrete or masonry structure dampproof and waterproof. The fact that it results in a clean, neat and pleasing surface renders its use satisfactory for plastering or lining basement walls, for surfacing floors, and other interior work.

A Word as to the Quantity of Waterproofing Needed

Though somewhat less than the quantity recommended may be used in many cases with excellent results, it has proved advisable in any structural work to have a reasonable factor of safety.

The need of such a factor of safety will be appreciated when the varying conditions affecting concrete work are considered.

Specifications vary considerably and so also do the aggregates selected.

It has been found that the quantity prescribed, 2% of the weight of cement (8 lbs. to the barrel) is the correct amount to be used. A reasonable factor of safety is included in this figure and we advise that this specification be rigidly maintained.

SERVICISED PRODUCTS CORPORATION

6051 W. 65th Street
CHICAGO, ILL.

Products

ASPHALT and ASPHALT-FIBER COMPOSITIONS; PLASTIC CEMENTS; ROOFINGS.

Expansion Joints

Type B Expansion Joint—A pre-moulded bituminous composition containing a high percentage of pure blown bitumen which is reinforced with saturated and unsaturated vegetable fiber. The special asphalt makes it exceptionally rigid in warm weather and gives it remarkable plasticity at low temperatures. It is advantageous because of its low moisture absorption, resistance to wear, long life and valuable functioning power. Its field of application includes concrete sidewalks, driveways, courts, basements, and other types of monolithic construction where expansion must be provided for.

Webbed Expansion Joint—Has reinforced felt sides, a fibrated bituminous core having a bitumen content of 80%. This is not a homogeneous structure but a reinforced saturated felt sided joint meeting all specifications for a joint of this description.

Type D Expansion Joint—This joint differs from ordinary materials since it is compressible within itself. The matted fiber core is waterproofed with a substantial layer of asphalt but can be compressed to one-half its thickness without being forced from the crevice. This important property makes it the ideal material for joints in bridges, stadiums, reservoirs, concrete conduits, roofs, etc. When placed between masonry and built-in structures such as sash, door frames, etc., it provides a cushion connection which means better construction.

Sewer Pipe Joints

Servicised premoulded sewer pipe gaskets comprise the most modern and efficient method for jointing sewer pipe. The consistency is such that they can be readily calked into place and because of their wedge-shaped section a tight joint is obtained without additional sealing materials. They are prepared in strips for all sizes of clay and concrete pipe and can be made in special shapes for other purposes.

Their flexibility, resistance to sewer liquors, resistance to plant growth, and ease of installation make them superior to the ordinary oakum-cement joint.

Servicised Sewer Pipe Compound—An asphalt-mineral mixture prepared for the pouring of joints. It is very inert and adheres very tenaciously to the pipe surface. When properly installed, joints made with this compound will withstand pressures often in excess of the strength of the pipe itself.

Roofing Materials

Built-up Roofing—Servicised built-up roofing involves the use of the highest grade saturated felts and Servicised long life asphalt. It may be laid up with from 2 to 5 layers of saturated felt depending upon the specifications and surfaced with either a cap sheet or sand and gravel finish. All sheets are cemented together into a monolithic flexible roofing by special Servicised Mopping Asphalt.

Asphalt Shingles—Red or green slate surfaced asphalt shingles are furnished in both the slab and hexagon form. Weights vary with the grade of shingle to a maximum of about 260 lb. per square for the extra heavy.

Slate Surface Roll Roofing—Slate surface roofings are furnished with the standard weights of felt, and in red and green colors. Rolls contain 108 sq. ft. and when wrapped complete weigh about 85 lb.

Servicised Roof Cement—A highly waterproof and inert plastic material which is prepared in several consistencies for troweling. The most severe weather conditions do not cause it to run and the tough flexible properties are not lost in cold weather. It is invaluable for sealing crevices, roof flashings, skylights, and similar places where hot material cannot be poured or is otherwise unsuited.

Servitite Asbestos Roof Cement—This coating provides a material for surfacing leaky built-up roofs with an impervious non-cracking layer of bitumen. The superior grade of asphalt used makes it highly weatherproof and the long fibered asbestos prevents the cracking which usually takes place after several years.

Servicote Asbestos Fibre Coating—A high grade fibrated liquid coating of a brushing consistency adapted for coating

new and defective built-up gravel, tin, slate surfaced, and smooth surfaced roofs. Easily applied and forms impervious, tough, elastic surfacing at exceptionally low cost.

Servicised Roof Paint—A paint prepared for coating saturated felt roofs to prevent them from drying out and losing their moisture resistance. It can be easily applied with a brush and forms a highly economical surfacing material.

Servicised Flashing Blocks—Specially shaped bituminous felt blocks which eliminate many of the troubles encountered obtaining a weathertight joint between the roofing materials and the vertical walls. They are made in a standard size and laid directly in the masonry wall in place of the equivalent brick. The prepared roofing is embedded in a slot in the block and by the use of either lap cement or roof cement a watertight joint is obtained. The value of a permanently sealed flashing can be appreciated by the numerous leaks which develop at this point when ordinary methods are used.

Flooring

Servicised Mastic Flooring is prepared in tilelike slabs which can be laid directly on a mopped coat of bitumen. The time-consuming method of troweling a plastic flooring as well as the inconvenience of hot mix application are eliminated. The material can be furnished in various shades ranging from red to black and in tiles of any desirable dimension. These mastic floors are resilient, noiseless, waterproof, and durable and are recommended for office buildings, industrial buildings, platforms, etc.

Felt Brick

Servicised Felt Brick is an asphalt-felt composition made in standard brick size for wall construction. A facing of felt brick in foundations gives a superior type of dampproofing as well as heat insulation. They are laid using a bituminous cement which, after the evaporation of the solvent, becomes tough and flexible and binds the bricks into an almost solid asphaltic layer.

Bituminous Packing

Bitupack is a stranded bituminous composition which is moistureproof, plastic, and easily calked into place. As a calking material it surpasses the ordinary stranded fibrous materials, because it is not subject to deterioration. It can be used sealing sidewalk crevices, around lamp posts and other structures set in concrete slabs, for sewer pipe joints, and numerous other places where a waterproof packing is advantageous.

Asphalt

Servicised asphalts are pure blown products prepared from high grade petroleum fluxes. Materials of various consistencies can be furnished according to specification and include products suitable for roof coating, saturating, mopping, waterproofing, rubber compounding, cements, etc. Much stress is laid on the fact that all these materials are remarkably free from brittleness at low temperatures.

Insulation

Servicised Insulating Blocks owe their high insulating value to the cellular unpenetrated fiber which comprises the chief filling material. Sufficient bitumen is incorporated to make the material unaffected by moisture and to act as a binder. For refrigerator walls this is very important since the insulating properties do not change even if moist conditions prevail. Low temperature insulation for other industrial purposes is efficiently and economically provided by the use of this Servicised product.

Gray Filler

Where a waterproof seal is required and where black asphalt is unsightly, Servicised Gray Filler is the logical material. It is very adhesive and can be poured at a temperature of about 250° F. It cools very rapidly and remains plastic over a wide range of temperatures. For vertical or inclined crevices it is compounded to a troweling consistency which hardens to a tough plastic material on exposure to the air. Liquid gray filler can be poured cold and is especially suitable for small openings and hair cracks.

SOMMERS & CO., LTD.

Manufacturers of Permantite Waterproofing Products

342 Madison Avenue

NEW YORK, N. Y.

Products

PERMANTITE LIQUID INTEGRAL WATERPROOFING.

DAMPPOOFING COATING; GRAY ELASTIC CEMENT; CEMENT COLORS.

Also Liquid Integral Cement Hardener; Anti-Freeze; Steel Coating; Foundation Coating; Stone Backing Paint; Semi-mastic Dampproofing; Mastic Dampproofing; Liquid Asbestos Roof Coating; Permantite Cement Floor Hardener; Liquid Protective Cement Floor Coating; Transparent Dampproofing; Masonry Coating in colors.

Services

SOMMERS & Co., LTD., are sole manufacturers of Permantite Waterproofing Products.

The personnel of SOMMERS & Co., LTD., includes waterproofing engineers and construction specialists. These men, with their fifteen years' experience, are at the disposal of architects and engineers, and will be glad to aid in solving waterproofing problems.

Where necessity demands special products, Sommers' chemists will gladly work them out in the laboratory.

Permantite Liquid Integral Waterproofing

A concentrated liquid waterproofing compound for waterproofing concrete and cement mortar.

Placed in the gauging water of the concrete, it acts as a lubricant and densifier of the concrete reducing the power of absorption and the permeability of the mass. In addition, it will hasten the initial set and strength. Used in cold water it will reduce the freezing point of the water.

Advantages of Permantite—Simplicity of use; low first cost; effectiveness, permanence.

Permantite concrete, owing to decreased porosity is more resistant to wear and to acids and alkalis.

Permantite has a lubricating action on the cement which causes the concrete or cement mortar to become more plastic and workable, producing a smoother and more waterproof surface than untreated concrete.

Tests—Show that Permantite Liquid Integral Waterproofing in addition to waterproofing adds to the early strength of concrete—the time when strength is most needed.

Tests of specimens cured in air show Permantite to be effective in increasing the impermeability and the strength of concrete and cement mortar at all ages.

Quantity to Be Used—

- 1 gallon to cubic yard of 1-2-4 concrete.
- 1 gallon to 100 square feet cement mortar 1-in. thick.
- 1 gallon to 1000 brick, 1-3 mortar.
- 1 gallon to 25 square yards of stucco.

Packages—Shipping weight, 11 pounds per gallon. Put up in 55-gallon drums, 30-gallon half drums, 5-gallon pails, 1-gallon cans (6 to a case).

PERMANTITE
TRADE-MARK

Dampproofing Coating

For the dampproofing of brick, stone or terra cotta walls above and below ground.

Permantite Dampproofing Coating is a black, elastic, full bodied, slow drying waterproofing and dampproofing compound applied with a brush to the interior surface of exterior walls.

Forms a perfect bond for plaster (not on concrete) and aids to insulate the surface to which it is applied.

Covering Capacity—80 square feet to the gallon, one coat.

Packages—Shipping weight, 9 pounds per gallon. Put up in 55-gallon drums, 30-gallon half drums, 5-gallon pails, 1-gallon cans (6 to a case).

Gray Elastic Cement—Pointing and Calking Compound

For calking window and door frames, pointing masonry and terra cotta joints and flashings of all kinds.

A plastic material composed of weatherproof, waterproof and elastic bonding oils and gums, properly reinforced to permanently fill interstices. Will remain elastic and unaffected by weather.

Other Colors—Also made in black, buff, red and brown.

Packages—Put up in barrels, half barrels, 5-gallon pails, 1-gallon cans (6 to a case). Shipping weight, 15 pounds per gallon.

Cement Colors

For cement, mortar, stucco, plaster and composition flooring. Will give useful, permanently pleasing and decorative effects.

Permantite Cement Colors consist largely of metallic and mineral oxides and have great strength and permanence. They will assist in strengthening and waterproofing the mortar. Permantite colors are very economical due to small quantities required.

Colors—Black, cream buff, oxide red, brilliant red, deep brown, blue and green.

Packages—Packed in barrels, 100 to 600 pounds, approximately. Black is packed only in 12½-pound bags (12 to a case).

Products

Waterproofing, liquid, paste and powder; Dampproofing; Acidproofing; Rustproofing; Concrete Hardeners; Wood Preservatives; Portland Cement Paint; Caulking Compounds; Canvas Preservatives; Cement Coatings; Cement Patching Compounds; Mastic Flooring; Stucco and Composition Flooring; Mortar Paste and Stucco Colors; Plaster Bond and Stone Backing; Fireproof Nailing Concrete; Oilproof Coatings; Slipproof Cement Grains; Cement Accelerators, colorless and colored; Iron Cement; Wood Cement; Tile Cement; Freezeproofing Compounds; Wax Compounds; Floor Dressings; Boiler Compounds; Boiler Putty; Roofing Paints and Cement; Aluminum Paint; Shingle Stains; Metallic Hardeners; Bonding Compound; Technical Paint and Varnish; Plastic Paint; Tiles.

Description and Uses of Products

Konset, an Integral Cement Mixing Compound—When mixed with concrete, provides four desirable conditions:

(1) Accelerates the initial and final set and increases the early tensile strength.

(2) Gives greater plasticity and workability.

(3) Increases density, making it hard and waterproof.

(4) Increases freezing resistance.

Konset is also made in any color in dry powder form, which produces any desired color effect in cement mixtures, such as floors, walls, mortar joints, and it is also used for making cement, brick and tile.

By using Konset in colorless or colored form you save time, labor and money, and at the same time make a surface that is hard, waterproof, and dustproof. This product is a lasting benefit to architects, engineers, contractors and owners.

Kemi-kal Cement Surface Hardener—In liquid or crystal form. This chemical is for hardening and dustproofing cement floors, walks and roads after they are laid. It also is used for stucco and plaster.

Konseal—A colored liquid filler for hardening and dustproofing cement floors after they are laid; serviceable and ornamental. A sanitary treatment for cement and concrete surfaces. Made in all colors.

Kontite-Portland Cement Paint—A flat coating in dry powder form made from portland cement. It is mixed with water instead of oil, for stucco, brick, stone, plaster, wall board, and all interior and exterior surfaces; is fire-resisting, sanitary, odorless and weatherproof. Made in gray, blue, red, buff, brown, green, white and cement color; or any shade to match.

Sulco Liquid Waterproofing—A liquid integral waterproofing for all mass concrete or any place that portland cement requires waterproofing.

Sulco Waterproofing Powder—For mixing with the dry cement before sand and water are added.

Sulco Waterproofing Paste—A heavy white paste which is added to the gauging water that is used for mixing the concrete.

Rustcotine—A chemical compound in which petroleum products are used as a base vehicle to carry the rust inhibitive chemicals which prevent rust and corrosion. Made in a paste and a semipaste form, and does not harden like a paint.

Sulco Mortar and Stucco Colors—Sulco Mortar Colors possess the characteristics of durability and permanency as they will not fade. The colors run uniformly as to shade, due to the special process used in manufacturing. Sulco Paste Mortar Colors are the finest and strongest for tinting mortar, or cement; quick setting, dustproof, waterproof and freezeproof.

KONSET

REG. U.S. PAT. OFFICE

Sulco Oilproof Coating—A liquid coating for oilproofing all surfaces that come in contact with gasoline, kerosene, naphtha, crude oil and its by-products.

Wood-Seal—Preserves new or old wood floors, composition floors, cork, rubber and linoleum; prevents warping, wear, rotting, disintegration or splintering.

Sulco Wood Preserving Oil—A product of wood obtained from the tar produced from the distillation of hardwood—principally oak, hickory, beech, birch and maple. Protects wood from rotting, checking, swelling and shrinking. Experts are available for the solution of any waterproofing problem or other technical information.

Iron-Cote—A metallic hardener for concrete floors in factories, garages, loading platforms, piers, packing houses, etc. It is composed of finely ground iron and other materials; is incorporated in the topping of concrete floors, making them capable of standing the effect of heavy service and protecting them against dusting.

Bux-Skin—A liquid for preserving and rendering awnings, tents, tarpaulins, curtains, covers, fisherman's riggings, hatch covers, canvas and cotton duck goods proof against mildew and water.

Art-Cote—Plastic paint for obtaining rough plastered wall effects.

Aztex—Chemical cement stains.

Sulco Niloak Tile—For Egyptian, Indian or Aztec motifs.

Cemset Quick Setting Compound—This solution will accelerate cement and freezeproof concrete at 15° above zero without the use of salamanders or other devices.

Sulco Slipproof Grains—An abrasive material in loose form for impregnating cement or composition floors or stair treads to prevent slipping.

Fibermix—For floors, roofs, partitions, plaster and stucco. Nailing concrete and fiber mix combined.

Sulco Glazing and Caulking Compound—For bedding, glazing and caulking skylights, conservatories, hothouses, sheet metal frames, window frames, wood sashes, roofs, walls, concrete copings, swimming pools, tile floors, seams in boats, etc.

Sulco Plaster Bond, Dampproofing and Stone Backing—A dampproof bonding paint, permanent and adhesive.

Sulco Wax Compound—For polishing and treating old and new cement and wood floors; gives a beautiful luster. Easy to clean and soft under foot.

Sulco Boiler Compound—A scale solvent for treating boiler feed water. Prevents corrosion.

Sulco Iron Cement—For smoothing the surface of steel and iron castings and repairing blowholes and other defects, filling up spongy castings, covering up countersunk bolt heads, pipe joints, or all places where an iron or steel patch is required.

Deflect-O-Lite Aluminum Paint—Deflects the solar heat and keeps the surface cool, protecting it against corrosion. For coating steel storage tanks, water tanks, steel bridges, metal buildings, penstocks, boilers, smokestacks, gas holders and all metal surfaces, concrete, brick and plaster.

Other Sulco Products—We make a specialty of manufacturing railroad and industrial paints and varnishes on specifications; so in purchasing material of this kind you are buying high class products 100% pure, which include: inside white; flat wall paints; factory paints; shingle stains; roof coatings; roofing cements, etc.

Products

"LAPIDOLITH," the Liquid Chemical Hardener and Dustproof for concrete floors and Waterproof for concrete and stucco walls.

"SONNEBORN'S CEMENT FILLER and DUSTPROOFER" for cement floors (transparent and in colors).

"HYDROCID" WATERPROOFING PRODUCTS for interior and exterior surfaces.

"LIGNOPHOL," a Preservative for wooden floors.

"CEMCOAT," an Improved Mill White.

"CEMCOAT" FLOOR ENAMEL.

"SONOTINT," a Flat, Washable Wall Coating.

"MARVELWITE," a Fume and Heat-resisting Enamel.

Also Amalie Structural Steel Paints, Galvacote, a coating for galvanized iron; Amalie Pipe Enamel; Amalie Radiator Enamel; Amalie Stack and Boiler Paints; Amalie P & D House Paints; Enamelife.

Hardening, Dustproofing and Waterproofing Old or New Concrete Floors

"Lapidolith"—A liquid chemical which penetrates concrete floors, rendering them hard, dustproof, wear-proof and watertight. When applied to old concrete floors, "Lapidolith" will prevent further dusting and disintegration. It does not change the color of concrete.

An Investigation of the Action of "Lapidolith" on Concrete—Following is an extract from the official report of Prof. R. J. Colony of Columbia University, New York, as the result of an examination by him, under the microscope, of treated and untreated concrete:

"The external application of 'Lapidolith' to concrete surfaces results in (a) the formation of an optically isotropic but crystalline substance, derived by a reaction between components of the 'Lapidolith' and the cement matrix of the concrete which (b) has a tendency to fill in voids and cavities and act as a binding agent, thus rendering the surface smoother and more uniform."

No. 1. Untreated Concrete

No. 2. Lapidolized Concrete

Microphotographs of Specimens of Concrete

Magnified 50 diameters

No. 1. Note large numerous voids (black spots) and roughness of surface.

No. 2. Note roughness is reduced and voids filled with network of newly formed hard crystalline substance

Application—"Lapidolith" is mixed with water and flushed on the floor as per detailed directions to be furnished.

Special Service Work—We also contract to apply "Lapidolith" with our own men under the supervision of a service engineer on areas of 20,000 sq. ft. or over at a substantial saving to the owner in material and labor.

Specification for Concrete Floor—Harden and dustproof the following concrete floor (.....) or as noted on the drawings with 3 applications of "Lapidolith," manufactured by L. SONNEBORN SONS, INC., New York, N. Y., and applied as per their directions.

Filling and Dustproofing Concrete Floors Subject to Light Wear

"Sonneborn's Cement Filler and Dustproof," for concrete floors where there is no excessive wear. Furnished either transparent or in attractive gray shades. Covering capacity per gal., 1 coat, is 350 sq. ft.; 2 coats, 200 sq. ft.

Specification—Fill and dustproof the following cement floors (.....) with 2 coats of "Sonneborn's Cement Filler and Dustproof" manufactured by L. SONNEBORN SONS, INC., New York, N. Y., applied as per manufacturer's directions.

"Hydrocide" Waterproofing Products

"Hydrocide" No. 633 (Also Hydrocide Mastic and Semi-mastic)—Plaster bond for dampproofing the inner surfaces of outside walls above foundations.

Ready for use, applied cold with a brush. Saves furring and lathing expense. Should not be applied to smooth concrete surfaces which are to be plastered unless walls are sufficiently roughened. Covering capacity per gal., 1 coat, is 65 to 100 sq. ft.

"Hydrocide" No. 648 (Also Hydrocide Mastic and Semi-mastic)—For waterproofing outer surface of foundation walls and footings.

Ready for use, applied cold with a brush. Covering capacity per gal., 1 coat, is 65 to 100 sq. ft.

"Hydrocide" No. 611—For the protection of unexposed surfaces of limestone, caen stone, marble and other fine stones, from stain caused by absorption or communicated by surrounding masonry. Covering capacity from 250 to 350 sq. ft. per gal.

"Hydrocide" Integral Powder—For waterproofing mass concrete, concrete walls, floors, elevator, boiler and battery pits, swimming pools, water tanks, etc. Mix 2 lb. of "Hydrocide" integral powder with each bag of portland cement, then add to sand and stone mixtures.

"Hydrocide" Integral Paste—For waterproofing cement, stucco and mortars. For every bag of portland cement, use 1½ qt. of a mixture consisting of equal parts of "Hydrocide" paste and water.

Waterproofing Exterior Walls Above Grade without Changing Appearance of Walls

"Hydrocide Colorless" contains no wax, paraffin or similar substance disfiguring the surface.

Grade "A" for light colored surfaces, such as plain concrete and stucco, etc.; "B" for red and buff brick, colored concrete and stucco; "D" for very porous surfaces, such as limestone, concrete cast stone, etc.

Preservative for New and Old Wood Floors

"Lignophol" is a preservative composed of natural wood gums and oils. It penetrates to a considerable depth below the surface of a wood floor, filling the voids in and between the cells and fibers. Prevents splintering, cracking, warping and dry and wet rot.

"Lignophol" also acts as a dampproofing and dust-proofing. Contains a powerful fungicide which checks the growth of fungus and mold. It prevents the disintegration of the wood fibers. It makes floors resilient and more resistant to heavy traffic and wear.

"Lignophol" is satisfactory for wood floors of all kinds in office buildings, churches, schools, hospitals, factories, bakeries, laundries—in fact, in all buildings.

"Lignophol Wax Finish"—For dance floors, residence floors and wherever a medium or high gloss is desired. One coat produces a medium gloss; 2 coats produce a high gloss. Lignophol Wax Finish is also very satisfactory for wood trim.

Covering Capacity—One gallon covers about 350 sq. ft., 1 coat, or about 200 sq. ft., 2 coats. New floors require 1 coat; floors subjected to heavy traffic and old floors should receive 2 coats. Furnished in four colors: natural, light oak, medium oak and dark oak.

Specifications—After scraping, all wood flooring shall be given 1 application of Lignophol, manufactured by L. SONNEBORN SONS, INC., New York (color to be selected) and applied in accordance with manufacturer's directions. (Specify 2 coats for floors subjected to heavy wear.)

Lignophol Wax Finish—For medium gloss: After scraping, all wood flooring shall receive 1 application of Lignophol Wax Finish, manufactured by L. SONNEBORN SONS, INC., New York (color to be selected) and applied in accordance with manufacturer's directions. About 6 hours following application, the surface should be polished. (For high gloss specify 2 coats. Apply second coat after first coat has been polished.)

"Cemcoat," a Sanitary, Washable, Light-reflecting Enamel Paint for Interior Walls and Ceilings

A white enamel paint which will stay as white as the most expensive enamels. Very opaque, 2 coats will cover as well as 3 coats of ordinary lead and oil paint. Is not poisonous. Is sanitary, can be washed with soap and water or even with a hose without affecting the surface. Will not peel, crack or blister if properly applied to a normal surface.

For Interior Walls—Can be used on concrete or any other masonry materials, wood or metal. A coat of "Cemcoat" flat undercoat followed by a coat of "Cemcoat" finish will give best results. For very porous surfaces 1 coat of Amalie gypsum size and 2 coats of "Cemcoat."

White Gloss Finish "Cemcoat"—Reflects all the light and disseminates it equally throughout the room. It is also more easily cleaned than the eggshell or flat.

Eggshell Finish "Cemcoat"—Recommended for

walls and ceilings in offices, schoolrooms, etc., where glare is to be avoided.

Colors—Made in all standard colors.

Covering Capacity—Approximate number of square feet per gallon, per coat:

	First Coat	Second Coat
Concrete	250	300
Brick	250	300
Plaster	300	350
Wood	400	450
Metal	400-500	500-600

Exterior "Cemcoat" for Exterior Walls

For decorating and dampproofing exterior walls above grade. Comes in 12 attractive colors, flat or gloss finish.

Covering Capacity—On concrete, brick, stone and stucco, approximately 175 sq. ft. for 2 coats; on wood and metal 250 sq. ft. for 2 coats.

"Cemcoat" Floor Enamel

A very durable and elastic floor coating which comes in 8 colors and dries with a high gloss. One gallon covers approximately 200 sq. ft. with 2 coats.

"Sonotint," a Flat Washable Oil Paint for Interior Walls and Ceilings of Hospitals, Schools, etc.

A flat oil paint ready for use, which has all the softness and finish of water colors, with the advantage of being washable. It reflects the light without glare. Manufactured in 16 different shades. A color card will be sent on request. "Sonotint" forms a very hard elastic surface not affected by soap and water. Being very opaque, 2 coats cover perfectly and set without showing brush marks.

Covering Capacity—Will cover approximately 250 sq. ft. per gal., 1 coat.

"Marvelwite," an Enamel Which Resists Chemical Gases, Fumes and Vapors

An enamel to meet demand for an intensely white wall coating which has highest resistance to conditions which turn color of average enamels. Highly resistant to influences of most chemical gases, fumes and vapors as they exist in laboratories, tanneries, bleacheries, textile mills, laundries, bakeries, chemical plants, hospitals, operating rooms, rubber and tire plants.

Covering Capacity—"Marvelwite" enamel, 500 sq. ft. per gal., 1 coat. "Marvelwite" undercoating, 350 sq. ft. per gal., 1 coat.

Further Information

The following printed matter sent on request:

"Specification Data" Portfolio to fit standard correspondence files comprising: floor treatments, damp-proofing and waterproofing; interior and exterior painting, technical paints.

Individual Specification Sheets on "Lapidolith," covering schools, hospitals, factories, warehouses, packing plants, bakeries, creameries, garages, power plants.

Circular: "A Scientific Investigation of the Value of 'Lignophol.'"

Booklet: "Preservative and Strengthening of Wood Floors."

Samples treated with Lapidolith, Lignophol, Cemcoat, etc.

For Paints and Varnishes, see pages B1668-1669.

Architectural Service

THE TRUSCON LABORATORIES manufacture a complete line of waterproofings and paint coatings formulated to meet each individual requirement. The representatives of THE TRUSCON LABORATORIES are technically trained men whose duty it is to assist architects, engineers and owners in the selection of the proper material to meet their protective and decorative problems, by making a complete study of the requirement and furnishing detailed recommendations as desired and without obligation.

Truscon Waterproofing Paste, Concentrated

Definition—An integral compound for producing thoroughly waterproof concrete or cement mortar. It is adapted to waterproofing concrete construction of various kinds—foundations, reservoirs, tunnels, dams, cisterns, etc. Also used for waterproofing old brick, concrete and stone structures through the agency of a cement plaster coat into which the waterproofing is introduced. Truscon Waterproofing Paste is also used for producing waterproof cement stucco and cement mortar.

How Used—Truscon Waterproofing Paste, Concentrated, is incorporated into concrete or cement mortar through the medium of the water used for tempering the mix. Being in paste form, it diffuses itself readily through the water, forming a milky mixture. This milky appearing mixture of paste and water is used for tempering concrete or cement in the place of clear water.

Advantages—(1) Water repellent; kills capillary absorption of moisture into concrete or cement plaster. Since "plugging the pores" of cement is physically impossible, the repellent feature of Truscon Waterproofing Paste is the most practical and scientific method of waterproofing.

(2) Colloidal; is concentrated colloid and hence adds to the normal colloidal content of cement mortar, thus increasing its resistance to weathering and wear.

(3) High concentration and freedom from useless filler—it is all waterproofing—contains no clay, lime or such material.

(4) In paste form—the form most easily mixable with wet concrete or cement mortar batches. This insures even distribution of the waterproofing.

(5) Inert—does not react chemically with cement; hence does not lower the strength of the concrete.

(6) Lubricates the mix by cutting the "skin strength" of water—producing a concrete which "chutes" easily to the forms, also a more dense and compact concrete. In the case of cement mortar or stucco, "lubrication" makes these materials of creamy consistency and much easier to apply. Avoids mottling of surface of cement stucco.

(7) Insoluble in water—hence can not be washed out of the concrete or affected by time or weathering. This is an important point because so many of the waterproofings on the market will dissolve in water.

Specifications for Waterproofing Mass Concrete

Estimate 7 lb. of Truscon Waterproofing Paste to the cubic yard of concrete. Applicable to concrete foundations, reservoirs, tunnels, cisterns, swimming pools, etc.

Method—Water tightness shall be secured by the addition of Truscon Waterproofing Paste, concentrated, to all water used to temper the dry mixture of cement and aggregate in the proportions, and mixed, as directed below.

Ingredients and Proportions for Concrete—The concrete composing the structure shall consist of 1 part of cement, 2 parts of sand and 4 parts of stone (1:2:4) properly graded in size from coarse to fine.

The waterproofing is added in the proportion of 1 volume of Truscon Waterproofing Paste to 36 volumes of water in the following manner:

Mixing—First, mix 7 gal. Truscon Waterproofing Paste with 5 gal. of water. Second, use 1 qt. of this paste and water mixture to each bag of cement, adding same to the dry cemented aggregate. Then temper with clear water as usual.

Placing—All concrete shall be placed in one continuous operation, each pouring being thoroughly spaded. In cases where joints are unavoidable, care shall be taken to clean and roughen the old surface, and have it thoroughly wet and slush coated immediately before placing additional concrete.

Specifications for Waterproof Cement Plaster Coat

Estimate 6 lb. of Truscon Waterproofing Paste to the 100 sq. ft. of $\frac{3}{4}$ -in. plaster coat applied to the walls, and 16 lb. of paste to the 100 sq. ft. of 2-in. finish applied to the floor. Applicable to reservoirs, swimming pools, cisterns and similar forms of masonry construction, whether of brick, stone or concrete.

Method—Water-tightness shall be secured by plastering the interior surface of the structure with a continuous coating of portland cement mortar waterproofed with Truscon Waterproofing Paste, Concentrated.

Ingredients and Proportions for Waterproofed Plaster Coat—The mortar composing the plaster coat shall consist of 1 part of cement and 2 parts of clean sand (1:2), free from organic matter and uniformly graded.

Preparation—The waterproofed cement mortar shall be prepared by thoroughly tempering (to required consistency) a dry mixture of 1 part of cement to 2 parts of sand, with water to which Truscon Waterproofing Paste, Concentrated, has been added in the proportion of 1 part of paste to 18 parts of water, and thoroughly mixed as follows:

First, mix 1 gal. of Truscon Waterproofing Paste with 1 gal. of water. Second, use 2 qt. of this mixture to each bag of cement, adding same to the dry cement and sand. Then temper with clear water as usual.

Preparation of Surface to be Coated—Before plastering the waterproofed cement mortar on to the hardened concrete, brick or masonry, proper precautions should be taken to insure thorough bonding and keying of the plaster coat to the wall.

Application of Coating to Sides—Immediately after applying a slush coat, the waterproofed plaster shall be applied in 2 coats each $\frac{3}{8}$ in. thick as per specifications of the manufacturer, the second coat being applied just before the first has reached its final set.

Application of Floor Coating—Floors shall be prepared and treated with equal care as the walls to insure proper bonding of the mortar, and finished with a waterproofed cement mortar to a thickness of 2 in. Special care must be exercised in joining the wall coating to the floor coating, so that there is a continuous waterproof coating over the entire surface.

Pressure—When moisture is seeping through the walls, proper drainage must be provided during the application and setting of the plaster coat, until such time as the plaster coat has set and is capable of resisting pressure of its own adhesive strength.

Truscon Ferritex

Dampproof wash for cement or concrete surfaces.

A pulverized iron compound, made chemically active, that when used as a brush coat over concrete or porous masonry, plugs up the pores and acts as a dampproofing.

It is often desirable to specify Ferritex as a dampproofing for the interior of cellar walls or concrete tanks where a black dampproofing compound would not give service and a water-proof cement plaster coat is found too expensive. It is to be noted, however, that where a decided hydrostatic pressure is encountered Ferritex is not recommended. For such severe conditions, the only remedy is the use of Truscon Waterproofing Paste Concentrated applied in a plaster coat.

Specifications for Ferritex

All concrete shall be dampproofed by the application of (1 to 5) thorough brush coats of Truscon Ferritex, (a porous concrete requires a greater number of brush coats than a dense concrete,) as manufactured and recommended by THE TRUSCON LABORATORIES, Detroit, Mich.

Condition of Surface—The surface shall be thoroughly cleaned of dirt, grease and foreign matter.

Application—Ferritex powder as received in the can from manufacturer, shall be mixed with water in the proportion of 4 lb. of Ferritex to the gallon of water and applied to the surface with a good, stiff, bristle brush. Allowing from 5 to 6 hours in between coats for drying. The mixture must be kept continually agitated during each application, to insure powder remaining in suspension in the water.

Truscon Stuccotex

Paint for wet concrete and masonry.

A hydraulic paint for uniforming concrete and masonry surfaces, or for decorating wet or damp stone, brick or concrete surfaces, such as swimming pools, retaining walls, etc., on which oil paints cannot be successfully used.

Stuccotex is a dry powder which is mixed with water to the right consistency and brushed on to the surface after that surface has been thoroughly saturated with water.

Stuccotex does not flake nor crumble.

Covering Capacity—125 sq. ft. per gal., 2 coats.

Specifications for Stuccotex

All wet surfaces shall be given 2 coats of Truscon Stuccotex, as manufactured by THE TRUSCON LABORATORIES, Detroit, Mich.

Condition of Surface—Surfaces to be treated with Stuccotex shall be free of all loose particles, paint, cold water paint, size, oil, grease or any other foreign matter which would retard or prevent direct contact of Stuccotex with the surface.

Preparation—Mix Stuccotex thoroughly with water in the proportion of 10 lb. of dry powder with 2½ qt. of water. Mix only enough for immediate use. Any Stuccotex that has been mixed longer than two hours shall be thrown away.

Application—To the water saturated surface (not merely wet, but saturated) apply the first coat of Stuccotex, brushing same carefully into the pores. After the first coat has set about 12 hours, thoroughly saturate surface and apply a second coat.

Caution: Keep Stuccotex surface wet—during very warm or dry weather, spray the surface for several days while painting. Keep Stuccotex container dry and tightly covered.

Truscon Plaster Bond

A black compound for dampproofing interiors of exposed masonry walls. Plaster Bond remains flexible and tacky, providing a permanent bond for a scratch coat of plaster troweled directly on to it, thus eliminating furring and lathing. Plaster Bond is not recommended for use on ceilings.

Covering Capacity—About 80 sq. ft. per gal., 1 coat.

Specifications for Plaster Bond

The inside surface of all exposed walls of the entire building shall be given 1 uniform application of Truscon Plaster Bond as manufactured by THE TRUSCON LABORATORIES, Detroit, Mich.

The coating shall be perfectly continuous over the entire surface. In cases where the Plaster Bond cannot be run continuously back of the floor construction, it shall be applied back on the ceiling for at least 12 in. from the wall.

Special care shall be taken to coat all portions of the wall where there is any cutting out to permit the passage of pipes subsequent to the application of the Plaster Bond. All portions of the wall which are particularly absorbent shall be given a retouch coat, so that the entire area will have an even, uniform appearance.

The plaster shall not be applied until 24 hours after the wall has been coated with Truscon Plaster Bond.

Foundation Coat

A black coating furnished ready for use (no heating) for dampproofing masonry walls below grade. Apply with a large mop or brush. More economical and satisfactory than coal, tar, or pitch.

Covering Capacity—80 sq. ft. per gal., 1 coat.

Specifications for Foundation Coat

General—The outside surface of all foundation walls shall be given 2 uniform applications of Truscon Foundation Coat as manufactured by THE TRUSCON LABORATORIES, Detroit, Mich.

Condition of Surface—The surface shall be thoroughly dry and free from any adhering earth or foreign matter so as to insure the thorough penetration and bond of the Foundation Coat.

Application of First Coat—Truscon Foundation Coat shall be applied over the dry masonry surface with a large brush or mop, exercising special care to insure a uniform continuous coat. Allow 24 hours for drying time and apply second coat in one continuous application.

Truscon Foundation Coat shall be allowed to dry for at least 12 hours before being backfilled.

Truscon Temperite

Quick set and antifreeze for concrete and cement mortar.

Truscon Temperite is a chemical compound for accelerating and regulating the set of cement mortars, giving protection against frost, and bringing the cement to its point of final strength and hardness in a much shorter time. It also helps retain moisture and thus assists in hydration and lubrication of the mass, giving a denser concrete.

Truscon Temperite is furnished in liquid, or dry concentrated form.

Specifications for Using Temperite

Truscon Temperite, manufactured by THE TRUSCON LABORATORIES, Detroit, Mich., shall be used in concrete or cement mortar as directed below:

If Temperite Liquid—Thin in the proportion of 1 gal. liquid to 10 gal. water. Use this mixture of Temperite and water in place of clear water for gauging the mixture of cement and aggregate.

If Temperite Dry Concentrated—Throw 2 lb. of Temperite Dry Concentrated into the mixer for every bag of cement, turning the mixer over a sufficient number of times to insure a thorough solution and distribution of Temperite.

Truscon Super-Por-Seal Transparent Dampproofing

A transparent coating for protecting and dampproofing exterior masonry walls above grade. May be applied by brush or spray. Super-Por-Seal is also suitable for use on unexposed sides of cut stone to prevent penetration of moisture and resulting discoloration.

Covering Capacity—80 sq. ft. per gal., 2 coats.

StoneTex Concrete Paint

The nationally known lime-resistant masonry coating for protecting and dampproofing exterior brick, stone, stucco or concrete. Furnished in white and 10 standard shades. Applied with a brush or spray. Prevents cold and moisture from filtering through masonry walls and avoids disintegration of concrete. Renovates and beautifies masonry buildings.

Covering capacity: about 100 sq. ft. to gal., 2 coats.

Floor Hardeners

Metallic—Truscon Floor Hardener is a metallic hardener designed for giving floors in factories, warehouses and such places greater resistance to wear. Forms a dense, hard finish. Especially applicable to new cement floors, or to floors which need resurfacing.

Quantity required: 30 lb. to each 100 sq. ft.

Chemical Dry—Agatex Crystals, a chemical hardener for cement floors, furnished in dry form. Dissolved in water and applied with a brush or broom.

Quantity required: about 1 lb. to each 40 sq. ft.

Chemical Liquid—Agatex Liquid, a chemical hardener furnished in highly concentrated form for stopping dusting and crumbling of cement floors. Applied with a brush, broom or similarly convenient instrument.

Quantity required: about 1 gal. to each 100 sq. ft.

TRADE-MARK

and factory buildings, printing establishments, etc., where protection without decoration is required.

"R.I.W." Cement Floor Enamel (Patented)—For a finishing coat on concrete and wood floors not exposed to the elements. Prevents "cement dusting" and resists wear. Furnished in semi-gloss and high gloss finishes.

"R.I.W." Dustop*—Intended for application to dry concrete floors with a mop, or it may be spilled on the floor and slushed around until absorption ceases, when the excess "R.I.W." Dustop should be removed. Resists abrasion to a limited extent, but its major function is as a dust preventive.

"R.I.W." Flintox*—A chemical solution which reacts with the cement and precipitates zinc silicious materials in the pores of the concrete. Intended primarily as a surface hardener, but because of the reaction and precipitation referred to, the material may be said to function as a binder and dust preventive.

Steel Preservative Paints

"R.I.W." Tockolith (Patented)—The portland cement gray anti-corrosive paint used for priming iron, steel or other metal. A finishing coat must always be applied according to the character of the finished surface required and the nature of the service expected.

No. 1087-A "R.I.W."—A quick drying, acid-proof, alkali-proof and waterproof china wood oil, hydro-carbon paint for application to steel or wood. Unaffected by the alkali in cement mortar and concrete. A good shop coat for steel which is to be incased in concrete where a paint of the character of "R.I.W." Tockolith is not required.

Furnished in black, red, brown and dark green.

No. 110 "R.I.W." Damp-Resisting Paint—A waterproof paint which adheres perfectly to concrete or cement mortar.

Used as a finishing coat on structural grillage work which is to be embedded in masonry, also on railroad bridge floors and column footings, pipes buried in the ground, metal lath and steel work subjected to the fumes of acids or alkalis.

No. 112 "R.I.W." Damp-Resisting Paint—A waterproof paint which has wonderful resistance to the alkalis in cement mortar or concrete. Recommended for finishing coat on structural steel building frames, brine and condenser pipes, etc.

Furnished in black and maroon.

No. 137 "R.I.W."—A bright red paint recommended either for interior or exterior use over a priming coat of "R.I.W." Tockolith, but 2 coats may be used without a primer.

Used on steel structures exposed to the weather; roofs, gutters, gas holders, tanks, etc., and where acid fumes prevail.

No. 49 "R.I.W." Damp-Resisting Paint—A high grade, exterior exposure paint made in black or dark olive green, and usually applied over a priming coat of "R.I.W." Tockolith.

Withstands the action of locomotive gases, acids and other fumes to which railroad bridges and viaducts are subjected. Used on tanks, lined smokestacks, etc.

"R.I.W." Plaster Primer—A liquid coating of semi-opaque character, made in white and light gray, intended for direct application to thoroughly dry and clean plastered walls. It overcomes the alkalinity of unpainted plastered walls and obviates the necessity of using sizing materials: i.e., glue size, sealing varnish or similar preparations.

Enamels

"R.I.W." Hospital and Laboratory Enamel—A waterproof, white, hard usage enamel which resists the action of sulphuretted hydrogen, gases and fumes of acids and other chemicals. Used principally in hospitals, laboratories, bath-rooms, kitchens, milk stations, engine rooms, etc.

"R.I.W." Machinery and Pipe Enamel—This enamel is intended for use on dynamos, transformers, steam and electric stationary engines, compressors, mill and other machinery, guards, rails, etc., not exposed to the elements.

Specialties

"R.I.W." Trimbak—A black, alkali-proof and waterproof, elastic paint for protecting the back of wood trim; underside of wood floors, wood sleepers, etc.

Damp-proofing

No. 232 "R.I.W." Damp-Resisting Paint—A black, elastic, full-bodied, tacky, damp-proofing paint for brush application to the interior surfaces of exterior brick or terra cotta walls to which hard wall plaster is to be directly applied. Prevents the penetration of dampness, and renders the inside of walls vermin-proof and stain-proof.

Not to be used on concrete walls or on ceilings of any kind, nor must concrete or portland cement mortar be applied directly over it.

No. 110 "R.I.W." Damp-Resisting Paint—A black, alkali-proof and waterproof, elastic paint to protect limestone, marble, granite and other cut stone from the chemical action and discoloration due to alkali in cement, and to moisture. Also resistant to mild acids.

"R.I.W." Marine Cement*—A black, damp-proof, thick liquid paint for brush application to the exterior of foundation walls and footings; concrete floor slabs, and wood sleepers laid in concrete. Does not need to be heated.

"R.I.W." Liquid Konkert (Patented)—Priming and finishing cement paints, ready for use, for damp-proofing, beautifying and overcoming the natural porosity of exposed stucco, concrete and masonry walls. In white and colors. Dries with a flat finish. For gloss finish apply "R.I.W." Flex-Sicco Ready Mixed Paint in any color.

"R.I.W." Toxloxpore*—A colorless, damp-proofing liquid, especially adapted for application to brick, concrete, stucco, limestone, and Bedford stone.

When applied to a perfectly dry surface it will prevent the development of efflorescence and the penetration of dampness.

Cement and Mortar Colors

"R.I.W." Cement Colors—For coloring portland cement construction to produce the richest shades in stucco, tile, sidewalks, etc. Usually sold in dry powder form. These mineral colors produce uniformly pleasing and permanent shades.

Furnished in 14 standard shades.

"R.I.W." Edinburgh Mortar Colors—Strong, permanent mineral colors for mortar joints. Not affected by heat or cold.

Usually sold in pulp form because of greater convenience in mixing. Furnished in 7 standard colors.

Waterproofing

"R.I.W." Toxement (Patented)—A gray powder for the integral waterproofing of mass concrete for foundations, floors, walls, bridges, piers, reservoirs, etc.

"R.I.W." Toxement lubricates concrete, increases its workability, plasticity and flowability, renders it non-porous, and eliminates necessity for extreme tamping and vertical chuting.

"R.I.W." Toxement Mortar Paste (Patented)*—For the integral waterproofing of cement mortar joints and stucco by arresting capillarity and perfecting the texture of the mortar or stucco through entirely normal means and in entire accord with the natural functioning of the other ingredients.

Concrete Floor Coatings

"R.I.W." Cement Filler (Patented)—Designed primarily for use as a priming coat on dry concrete floors subjected to ordinary conditions of service. It penetrates the pores, neutralizes the lime inherent in concrete and hardens the surface.

The finishing coat should be "R.I.W." Cement Floor Enamel.

No. 2626 "R.I.W." Cement Filler (Patented)—This material is similar to regular "R.I.W." Cement Filler but contains specially selected gums which yield a harder and glossier surface. Usually used on concrete floors subjected to severe conditions of service and to preserve dry, crumbly floors in loft

*Trade-Mark Registered.

THE WATERPROOFING COMPANY

345 East 33rd Street
NEW YORK, N. Y.

65 Albany Street
BOSTON, MASS.

Product and Services

Manufacturers of "Cow Bay" WATER-PROOF CEMENT.

Engineers and Contractors for WATER-PROOFING, making a specialty of CEMENT WATER-PROOFING. We contract for the waterproofing of basements, subways, reservoirs, vaults, tunnels, swimming pools, etc., guaranteeing a positive and permanent waterproofing of all kinds of masonry construction.

Designers and builders of REINFORCED CONCRETE CONSTRUCTION.

TRADE-MARK
Reg. U. S.
Patent Office

ness, applied in two coats. The floor work shall be 1 in. in thickness and is to serve as a wearing surface as well as a waterproof coating. All waterproofing shall be floated and troweled to a smooth and even finish free from imperfections.

Guarantee—THE WATERPROOFING COMPANY shall furnish written guarantee that all coating placed by them will be waterproof; that during a period of 2 years after completion of the work, they will promptly repair any leaks appearing through their waterproofing which are not due to causes beyond the waterproofer's control.

A Few Important Waterproofing Contracts

New York, N. Y.

Tunnels, Shawinigan Falls, Can., Northern Aluminum Co.
6 Telephone Buildings in various cities, John T. Windrim
51 Telephone Buildings in various cities, McKinzie, Voorhees & Gmelin

Experience

THE WATERPROOFING COMPANY introduced and perfected cement waterproofing. During the past 23 years this company has successfully completed thousands of difficult contracts in every section of North America, and have gone as far afield as Japan.

Advantages of "Cow Bay" Cement Waterproofing

No extra supporting walls required. Walls are left with a neat finish; no furring and plastering being necessary. Floor coating serves both as waterproof seal and floor finish. "Cow Bay" waterproof coating is as hard as the best portland cement finish; placed beneath grillages and column bases without danger of settlement.

Difficult Waterproofing Job Successfully Handled

The foundations of the Federal Reserve bank building, the deepest in New York, presented a most difficult waterproofing problem. These foundations were successfully waterproofed by us.

"Cow Bay" Waterproofing Specifications

Material—All interior surfaces of all exterior walls and upper surface of concrete floor slab throughout basement (or subbasement), elevator pits, machinery foundations, trenches, etc., as shown on plans, shall be waterproofed with "Cow Bay" Waterproof Cement, applied by THE WATERPROOF COMPANY.

Workmanship—All surfaces, before application of waterproof coating, shall be thoroughly chipped and cleaned, and coating applied not later than 24 hours after surface has been so prepared. A perfect bond must be secured with underlying masonry. Wall waterproofing shall be $\frac{5}{8}$ -in. thick-

Services

All work is done exclusively under contract and guaranteed to be and remain watertight. We sell no materials. Each office has a corps of trained mechanics working under the supervision of an engineer.

Contracts are taken for Treating Structures of Concrete, Brick or other Masonry, either old or new. Architects or Engineers are invited to call our Waterproofing Engineers in for consultation to assist them in the solution of problems involving Waterproofing, Dampproofing, Oilproofing, Restoring Distintegrated Concrete, etc.

Method Used

This system involves the use of Ironite Waterproofing, which is a finely pulverized gray iron containing chemicals. Upon brushing this on the walls with the addition of water, the particles are lodged in the surface pores. Due to the chemicals, rapid oxidation of the iron takes place with the resultant expansion of the iron particles. This swelling completely fills the surface pores and seals them against leakage. Sufficient coatings are applied to thoroughly fill all pores. The early coats make a filling or stuffing for the surface pores, and the succeeding coats form a highly oxidized iron filament. This iron oxide surface is extremely dense and impervious, not alone to the action of water, but also to oils, dilute acids, etc.

The treatment is applied on either the pressure side or the side opposite. In the latter case it is impossible to force the waterproofing away from the wall as the particles inside the surface pores have expanded therein and are an integral part of the structure.

Advantages of This Method

Our system is a positive one, requiring no assistance from integral compounds in the concrete. The bond secured between the waterproofing and the structure is so perfect that it will resist any hydrostatic pressure the structure is capable of withstanding. See comparison shown below and note the large saving in construction cost.

Character of Work

Waterproofing—Basement walls, floors, tunnels, powerhouses, subways, pits, swimming pools, reservoirs, dams, retaining walls, viaducts, etc.

Treatment—Fuel oil tanks, gasoline and lighter oil tanks, molasses tanks, pickling vats, unusual oil containers, etc.

Acidproofing—To resist soaps, greases, fats, etc. Treating floors and walls of packing houses, soap factories, tanneries, dairies and other structures, requiring protection against dilute acids.

Resto Crete—A process for restoring distintegrated concrete and preserving it from further disintegration.

Specifications

It is our preference to write a separate specification for each specific job. As a general specification the following may be used:

Basements, Tunnels, Pits, etc.—All enclosing walls and floors and other surfaces in contact with the earth are to be waterproofed on the inside surfaces by the WESTERN WATERPROOFING COMPANY (fill in here street and town address of nearest office) according to their system of waterproofing (using Ironite), and to be covered by their written guarantee.

GENERAL SALES OFFICE, 285 Madison Avenue, NEW YORK, N. Y.

Products

CAL, for use in portland cement mixtures to obtain early strength; to improve curing; for densifying; for easy workability; as a hardener; and for placing in cold weather.

Also Acme, Helderberg and Security Portland Cement; Berkeley Hydrated Lime.

What Cal Is

Cal is oxychloride of calcium, a dry white powder which, used as an admixture to portland cement concrete and mortar, has a combination of properties which facilitate and expedite new construction and repairs.

What Cal Does

Cal accelerates the hardening of all portland cement concrete and mortar, bringing them to safe working strength in a fraction of the usual time. Just as it comes from the container, Cal is added at the mixer. From actual tests and job experience covering many years, it has been found that when Cal is used, forms may be removed from all kinds of work in much less than normal time; and that road and street construction can be put into full service in from 48 to 72 hours. Road patching can be accomplished with little interruption to traffic. In addition, Cal cures, fattens, hardens, and densifies all portland cement mixtures, and reduces the cold weather hazard.

Workability

Cal reduces the amount of water necessary in making concrete; it prevents the segregation of the aggregates, and makes a concrete mixture more easily workable and easier flowing.

Cal fattens and stabilizes a concrete mixture so that segregation is reduced to the minimum. This is of special importance in chuting concrete or in transporting from central mixing plants.

CAL

Curing

Cal prevents the too rapid drying out of concrete or stucco in very hot or dry weather, and thus minimizes the danger of surface cracks, checks, crazing and disintegration.

No Danger of Corrosion

Three-year laboratory tests under the most severe conditions have proven that Cal does not cause corrosion of steel reinforcement.

Cold Weather Work

A conservative analysis of the experience of users indicates that Cal makes concreting and masonry work safe at temperatures 10° lower than for plain concrete or mortar and that with proper additional precautions work may proceed at very low temperatures.

Effect on Strength

There are innumerable laboratory tests which show conclusively that Cal increases the early strength of concrete with no ill effect on the ultimate strength.

The report of American Bureau of Inspection and Tests, Chicago, showed 2450 lb. concrete in three days. The mix was 1:1½:2½ and contained 5 lb. of Cal per bag of cement. In the same series of tests 1:1½:3 concrete treated with 5% Cal by weight of cement gave 2220 lb. in three days. Tests were made in compression on 6x12-in. cylinders with commercial aggregates, and air storage.

Compression Tests

The following table is from tests by Duff A. Abrams, eminent authority on concrete testing. It is taken from Bulletin No. 13 Structural Materials Research Laboratory of the Lewis Institute.

**Gulf Island Development Power House
on the Androscoggin River**

MORTON C. TUTTLE CO., Contractors

Cal used for densifying concrete in the scroll cases and for general frostproofing for the Central Maine Power Co.

**Addition to Corcoran Art Gallery,
Washington, D. C.**

JAMES BAIRD CO., Contractors

Cal used for frostproofing the mortar used in laying up the face brick

Harris-Forbes Building, Boston, Mass.

LOCKWOOD, GREEN & CO., Architects
GEORGE A. FULLER CO., Contractors

Cal used for brick mortar and for reinforced concrete roof slabs, without interruption at temperatures as low as 5° F.

The effect of Cal on the tensile strength of mortars is similar to its effect on the compressive strength of concrete.

Compression Tests of 6x12-in. Concrete Cylinders—Mix 1:5:2 by volume (1:2:4). Aggregate: sand and pebbles from Elgin, Ill., graded 0 to 1½ in. Cement: portland cement "A" purchased in Chicago. Relative consistency, 1.00 (flow about 180). Specimens cured in moist room until test, tested damp. Each value is the average of from 4 to 10 tests made on different days unless otherwise noted. Strength ratios are percentages of the strength of concrete at same age without admixture. Admixture expressed as per cent of weight of cement.

Cal, per cent	Compressive strength, lb. per sq. in.	Strength, ratio per cent	Cal, per cent	Compressive strength, lb. per sq. in.	Strength, ratio per cent

The Cal Book

The complete story of Cal is contained in this book which will be sent to any architect on request.

Specifications

All portland cement [concrete] [mortar] [stucco] [finish] shall be treated with Cal, manufactured by the NORTH AMERICAN CEMENT CORPORATION. Cal shall be used in the proportion of lb.* per bag of cement and shall be added dry to the mix, according to directions issued by the manufacturers.

*In normal temperatures, the following quantities should be used:

For stucco	5 lb.	Surface wash	8 lb.
Densifying	4 lb.	Easy chuting	5-8 lb.
Bonding and patching	5 lb.	For maximum acceleration	
Brick mortar	5 lb.	in any portland cement	
Brick mortar	5 lb.	mixture	8-lb.
Floor topping	3 lb.	For impermeability in any	
Concrete products	5 lb.	1:2:4 or richer mix	4 lb.

Potomac Edison Co. Power Plant, Williamsport, Md.

SANDERSON & PORTER, Engineering Contractors
Cal was used at all temperatures—in cold weather primarily for its frostproofing qualities and in mild weather for efficient long chuting—first on the original unit and now, four years later, on the additional unit

St. George's School, Newport, R. I.

CRAM & FERGUSON, Architects
L. D. WILCUTT & SON, Contractors
Cal used during the winter of 1925 for brick mortar on this building

Clark's Ferry Bridge Across the Susquehanna River, Above Harrisburg, Pa.

FRANK M. MASTERS, Engineer
VANG CONSTRUCTION Co., Contractors
By using Cal the number of arch centers required was reduced from 5 to 3 and the curing time from 28 to approximately 14 days, at an enormous saving

For cold weather, the following "Schedule of Safety" should be followed:

SCHEDULE OF SAFETY FOR COLD WEATHER

Nature of work	Temperature	Precautions
Floors, walls, brick mortar, roads and streets, mass concrete	Above 20° F.	Aggregates free from frost; 5 lb. Cal per bag cement
Stucco and thin sections	Above 25° F.	
Floors, walls, brick mortar, mass concrete	15° F. to 20° F.	Heat water and aggregates; 8 lb. Cal per bag cement
Stucco and thin sections	20° F. to 25° F.	Heat water and aggregates; 5 lb. Cal per bag cement; protect all exposed surfaces
Floors, walls, mass concrete	10° F. to 15° F.	Heat water and aggregates; 8 lb. Cal per bag cement; protect all exposed surfaces

Where to Get Cal

Building material dealers in most important cities carry Cal in stock. Orders may be sent to any office of the company, to be filled from nearest dealer's stock. Prices on request.

How Cal Is Packed

Cal is packed in convenient non-returnable 100-lb. heavy paper-lined burlap bags which preserve the material indefinitely when stored in a dry place.

Solvay Calcium Chloride for Accelerating the Setting and Densifying of Concrete

A white, dry, flaky chemical which when added to the mixing water accelerates the initial hardening of concrete without affecting the final set; at the same time densifies the concrete, making it more waterproof; reduces the freezing point of water, thereby aiding the green concrete to resist freezing in low temperatures. Calcium Chloride is extremely hygroscopic and dissolves almost instantly in water. It can be used with any brand of Portland cement, although results may vary slightly.

Results Proven by Authoritative Tests—Thorough and extensive tests made by U. S. Bureau of Standards, American Society for Testing Materials, Portland Cement Association, U. S. Engineers, Lewis Institute and our own engineers have definitely established that Calcium Chloride is beneficial to concrete.

At an investigation, carried on by the Bureau of Standards, co-operating with U. S. Engineers at Memphis, Tenn., with many materials, Calcium Chloride showed highest. In the standard mortar test with 3:1 Ottawa sand, it was found that 2 to 4%, by weight of water, of commercial Calcium Chloride increased tensile strength from 155 to 230% at the end of 24 hours; and from 173 to 190% at the end of 48 hours without adverse effect on the final set.

Comparative Strength Ratios between Treated and Untreated Concrete—After testing 7500 compression specimens, Prof. Duff A. Abrams; then in charge of Structural Material Research Laboratory of the Lewis Institute, Chicago, Ill., concludes:

"In the use of Calcium Chloride no advantage was gained for percentages of the commercial product greater than 2 or 3 per cent, corresponding to a chloride content of 1 to 1½ per cent. This amount when used in mixes of about 1:5 and in consistencies suitable for building construction, showed an increase in strength of from 100 to 200 pounds per square inch. For richer and drier consistencies the strength increase was greater and for leaner mixes and wetter concretes it was less."

Accelerating Properties—As shown by tests, concrete gauged with Solvay Calcium Chloride, at the end of 48 hours has the same strength as concrete gauged with plain water has at the end of 7 days. The early strength given to fresh concrete prevents collapse of the cell structure during the drying out period. It increases the crushing, tensile and abrasive strengths.

With Solvay, floor finishing is possible within a short time after pouring; concrete can be poured late in afternoon and finished, saving overtime charges.

Hardens and Densifies—The chemical action of Calcium Chloride densifies and hardens concrete and at the same time increases its resistance to dusting and absorption of water. This decreased porosity makes the surface more resistant to wear and less affected by acids and alkalies. All these qualities are highly desirable in construction of concrete sidewalks, as well as concrete floors in factories, garages, etc.

Advantage of Use in Cold Weather—The qualities of quick initial setting, hardening, densifying and reducing of the freezing point of the mixing water make it possible to progress with concrete work in continued cold weather. The usual precautions against cold weather must be taken, but the factor of safety is very materially increased by the use of Solvay Calcium Chloride.

Efficient solutions for use in freezing weather, using 6 gal. of water per bag of cement, are at 28° F., 2 lbs. to 6 gal. of water; 20° F., 3 lbs.; 15° F., 4 lbs.

Waterproofing Qualities—The integral method of waterproofing concrete has been found best by many engineers and architects. The same qualities of hardening, densifying and quick initial setting brought about by Solvay Calcium Chloride tend to make treated concrete more waterproof. An additional aid to the waterproofing is the plastic or "fatty" condition of the mix which makes easier troweling and produces a better finish.

Directions for Using Solvay—For the best results, use not less than 1 lb. nor more than 4 lb. to a bag of cement except in freezing weather when up to 6 lb. may be used. Solvay should be dissolved in the water before water is added to dry mix.

Estimate of amount to be used is approximately 2 lb. per bag of cement—conditions of temperature, location, mix, etc., will vary this amount.

Cost—Solvay Calcium Chloride, east of the Mississippi, costs, approximately, two cents per pound—in the far West cost is slightly higher.

Shipment—Solvay is shipped in 375 lb. net, metal drums or 100 lb. net, paper lined burlap bags; in bags it must be given the same care as given cement. Stock is carried in 75 cities in the United States. Special arrangement for handling by carload lots.

Where Used

Solvay Calcium Chloride has been specified by many of America's leading architects, engineers and contractors. A few of the buildings in which it has been used for the purposes described are:

Chicago Tribune, Chicago, Ill.
American Furniture Mart, Chicago, Ill.
Atlantic National Bank Building, Boston, Mass.
Central High School, Johnstown, Pa.
Hotel Kenmore, Boston, Mass.

Technical Service

THE SOLVAY PROCESS COMPANY maintains a Technical Service Department whose services are gladly given without charge to engineers and architects.

Literature

Copies of Prof. Abrams' report and booklet describing use of Solvay Calcium Chloride with concrete, together with Architects Specification sheet, sent free on request.

LIVING-STONE COMPANY

Living-Stone Concrete Bond and Lithotex Concrete Hardener

4 East Lee Street
BALTIMORE, MD.

Living-Stone Concrete Bond

Living-Stone is a non-acid method of bonding cement, concrete hardener, and granolithic top finish to concrete floors. It bonds new concrete to that which has already been placed, and is the tested method of building a perfect monolithic concrete structure. It overcomes the well-known disadvantages of ordinary grouting, as Living-Stone will not only firmly unite brick, stone or unglazed tiles to each other, but also effect *perfect cohesion with concrete that has "set."*

Acids are destructive to the lime in cement, and should never be used on concrete. Corroding acids will seep through porous concrete and start oxidation in steel reinforcing members. The use of muriatic or sulphuric acid, for bonding new and old concrete, has often been resorted to by many contractors, but a porous, spongy surface of no strength is produced. Living-Stone contains *no acids whatever*, and effects a positive and an impermeable bond.

For the following reasons, top finish should not be placed immediately after concrete base is poured: The finish can not be placed until the concrete is hard enough to walk on, and this concrete, being soft and uneven in composition, will settle and leave low places in the top finish. If the finish coat is placed too soon, it is necessary to protect it from the work which follows, and spaces occupied by scaffolding must be patched in afterward.

But with the use of Living-Stone, a perfect bond may be had between new top finish and the old base, after building is closed in. Concrete base can then be tested for specified floor loads. Sufficient time has elapsed and any imperfect concrete in base can be replaced. Floor level is fixed and can be depended on to remain as found.

Uses of Living-Stone

Among the many uses for which Living-Stone is adapted, the following might be mentioned:

Floor Finish—For bonding granolithic or concrete hardener top finish or tile to concrete floors.

Exterior Finish—Under stippling.

Repairs and Weatherproofing—For grouting, filling those joints and cracks caused by expansion and contraction.

Bridges, Dams and Chimneys—For producing absolute monolithic work.

Concrete Blocks—Affording means of refacing concrete block buildings that show signs of disintegration.

Reservoirs and Swimming Pools—Making impermeable joints.

Cost of Living-Stone

The expense of using Living-Stone is negligible in any work; 1 gal. is ample for an area of 250 to 300 sq. ft., making the cost about 1¢ per sq. ft. Full instructions for use are sent and they must be strictly followed.

Living-Stone is put up in 1 and 5-gal. cans and 50-gal. barrels. It will keep indefinitely, if kept sealed. For quantities of 5 gal. or less, cash must be sent with orders. If ordered in 1-gal. cans, 1-gal. price will be charged regardless of quantity ordered.

Always state whether shipments are to be made by express or freight. Orders of 10 gal. and less will be shipped by express unless specific instructions are received to ship by freight. State name of railroad by which shipments are preferred.

WEIGHTS AND PRICES

Container	Weight, lb.	*Price per gal.
1-gal. cans	14	\$3.00
5-gal. cans	60	2.75
50-gal. barrels	565	2.50

*F. o. b. cars, Baltimore, Md. Terms, net cash.

Specification for Bonding Top Finish to Concrete Floors

Living-Stone concrete bond shall be brought to building in original container, and applied in accordance with manufacturers' directions. Contractor, before proceeding with laying of cement, granolithic, concrete hardener top finish, or tiles, shall first thoroughly clean surface of dirt, dust, oil, paint or grease. Soak surface well with clean water and then apply a bond coat of Living-Stone $\frac{1}{4}$ in. thick, and immediately follow with top finish or new work.

Living-Stone does not require expert workmen to prepare it, as any ordinary laborer can attend to the mixing. Take a clean barrel, fill it with hot water to a height of 20 or 40 gal., mark barrel at each of these heights as a gauge for the mixer. Living-Stone is then poured into the barrel in the proportion of 1 gal. of Living-Stone to 20 gal. of hot water, and this solution is mixed with any brand of tested portland cement; mortar thus obtained should be of the consistency to flow sloppy from the trowel, and is spread, on the surface to be bonded, to the thickness of $\frac{1}{4}$ in., and the new work must follow immediately.

Do not spread more mortar than can be immediately covered while it is soft.

Lithotex Concrete Hardener

A colorless, liquid chemical compound which prevents and stops disintegration of concrete floors.

Lithotex changes a soft, porous wearing surface to one of flintlike hardness. It is inexpensive to apply, 1 gal. covering 100 sq. ft., 3 coats, at a total cost of 2¢ per sq. ft.

Specification—Lithotex shall be brought to the building in original containers and applied according to manufacturer's directions.

Wash the floor thoroughly with clean water, scrubbing with a stiff broom or scrubbing brush, removing all dirt and loose particles, and allow the surface to dry.

Dissolve 1 gal. of Lithotex in 3 or 4 gal. of clean water, depending on porosity and condition of top finish. Stir the mixture thoroughly and apply it with a brush. A long-handled whitewash brush will be found satisfactory. After applying mixture allow the surface thus treated to dry, and as soon as dry, wash off with clean water, using a mop. Make two more applications 24 hours apart, allowing the surface to dry between each application, and mop off as before.

Three applications will be all that is necessary. After the last application any of the Lithotex that remains on the surface can be readily washed off, and the pores in the concrete will be found to have been filled up, leaving a hard flintlike surface.

Weight and Prices—1 gal. cans, 15 lb., \$2.00 per gal.; 5 gal. cans, 65 lb., \$1.75 per gal.; 50 gal. bbl., 700 lb., \$1.50 per gal. Net cash, f. o. b. cars, Baltimore, Md.

GENERAL CHEMICAL COMPANY

Chemical Treatments for Hardening, Dustproofing, Waterproofing and Preserving Concrete Surfaces

KONAX INTEGRAL WATERPROOFING.
HARD-N-TYTE POWDERED IRON.

Hard-n-tyte Engineering Service

Surfaces are treated wherever possible under the supervision of the Hard-n-tyte Engineering Service. Our representatives are specialists in concrete construction, well qualified to study floor and waterproofing problems and, in the light of past experience and laboratory research, to recommend the correct materials and proper treatment for hardening, waterproofing, oil-proofing, acidproofing, densifying and protecting concrete and similar surfaces.

Our representatives will co-operate with architects, engineers, contractors or owners on problems relating to concrete, masonry, stucco and plaster. They are available at all times for inspecting and studying any specific job.

Hard-n-tyte Surface Hardener

Concrete floors, to give maximum service, should first be constructed according to the right specification and then treated with a reliable and standardized hardener.

Hard-n-tyte Surface Hardener is a combination of chemicals which, when mixed with water, forms a colorless solution. When applied to cement surfaces it penetrates and hardens them, eliminating the usual concrete dusting and making them flint hard, more dense and more resistant to wear and the elements.

The effect of its application to concrete, portland cement stucco, or other surfaces containing lime is a chemical reaction which deposits finely divided silica in the pores and voids and forms stable compounds. In addition to binding the particles of concrete more firmly together, the hard, agatelike substances which are formed by the chemical reaction resist abrasion and weathering.

When applied by our trained service organization, the results are guaranteed.

Specification—All exposed concrete wearing surfaces shall be treated with Hard-n-tyte Surface Hardener of strength specified by the manufacturer, GENERAL CHEMICAL COMPANY, and applied under the direction of an authorized sales engineer of said company.

Central High School, Minneapolis, Minn.

WM. B. ITTNER, Architect

Floors treated with Hard-n-tyte Surface Hardener withstand heavy traffic

Hard-n-tyte Decorative Coatings

Are supplied in gray, linoleum brown and olive green. They are not ordinary concrete floor paints, and should not be so considered.

In offices, public buildings and factories where an absolutely dustless surface is imperative, Hard-n-tyte Decorative Coatings harden the surface, produce a dustless finish at once, and at the same time give a uniform color and highly decorative gloss enamel finish. Surfaces treated in this manner are resilient and noiseless.

These coatings are easily maintained and withstand constant cleaning with strong soaps and washing powders remarkably well. The value of floor space thus treated is greatly enhanced and renting is made easier.

Specification—All exposed concrete wearing surfaces shall be treated with Hard-n-tyte Decorative Coating (specify gray, olive green or linoleum brown) in accordance with the directions of the manufacturer, GENERAL CHEMICAL COMPANY.

Note: The number of applications necessary depends entirely on the texture of the concrete, so that we prefer to have an outline of existing conditions before making recommendations.

Hard-n-tyte Liquid Wall Primer

New plaster and concrete surfaces contain a considerable quantity of active lime. When paint is applied to such surfaces the oil combines with the lime, causing disintegration. The bond between the paint and surface is either destroyed, causing peeling and blistering, or the paint becomes soluble and is easily washed off.

It is a liquid material for application to new plaster and concrete that seals the pores, hardens the surface, neutralizes the lime and stops the alkali action which discolors subsequent decorating. It saves time and reduces labor cost allowing the actual work of decorating to proceed more quickly than is ordinarily the case.

Specification—All plaster or concrete surfaces to be decorated shall be allowed to dry for at least ten days or until dry to touch, and then treated with Hard-n-tyte Liquid Wall Primer, strictly in accordance with the directions of the manufacturer, GENERAL CHEMICAL COMPANY.

Hard-n-tyte Colorless Waterproofing

This material meets the demand for a colorless penetrative surface treatment for concrete, stucco and masonry. It combines a special penetrative solvent with a large percentage of water-repellant, solid material. The solvent carries the water-repellant material far into

Hard-n-tyte Decorative Coating obviates the need for more expensive floor covering

Borden Farm Products Co., Chicago, Ill.

E. E. ROBERTS, Architect

Hard-n-tyte treatment prevents disintegration from lactic acid

the pores and then evaporates, leaving the surface coated and impregnated to a considerable depth with a sealing, water-resistive compound.

Being colorless, no film is formed to discolor the surface or change its texture.

Specification—All exposed masonry shall be treated in place when dry, with two applications of Hard-n-tyte Colorless Waterproofing, manufactured by the GENERAL CHEMICAL COMPANY, giving the surface a thorough saturation at each application.

Konax Integral Waterproofing

A liquid waterproofing compound added to the gauging water while the concrete is being mixed. When combined with portland cement, Konax acts as a lubricator, causing the aggregate to flow more easily into the forms and also lessens the amount of water required, thereby densifying the mass. It hastens the hardening of the cement so that greater initial strength is developed in less time, which makes possible earlier removal of the forms, saving time and expense.

Konax is recommended as a waterproofing and densifying agent in concrete—basement walls, cellar floors, swimming pools, cisterns and wherever impervious water resistant concrete is desired. It is used in cement topping as it produces a fatty condition of the cement that makes it easier to trowel, and brings about a smooth, dense, hard surface.

Masons also find this compound a valuable addition to brick mortar because of the same fatty result and its densifying action reduces the possibility of penetration of water through the mortar joints.

Cuddell Tower, Cleveland, Ohio

DERCUM & BEER, Architects
Artificial stone work protected by Hard-n-tyte Colorless Waterproofing

Specification—Wherever waterproof concrete or mortar is indicated, 1 qt. of Konax, manufactured by the GENERAL CHEMICAL COMPANY, shall be added to the mixing water for each sack of portland cement used.

Hard-n-tyte Powdered Iron

This material is furnished in two grades: 20-30 mesh for use as a metallic floor hardener and 80-100 mesh for bonding purposes and subgrade waterproofing.

Special Materials and Applications

Combined Hard-n-tyte treatments embodying a special Filler and our regular Hard-n-tyte Surface Hardener are employed to protect concrete wearing surfaces against the disintegrating action of oils, weak acids and alkali.

Various protective coatings and damp-proofings are also furnished for special conditions.

Guarantee

When Hard-n-tyte treatments are applied under the supervision of Hard-n-tyte distributors, results are guaranteed.

Typical Jobs

There are typical jobs in all sections of the country which demonstrate the successful results obtained from the use of various Hard-n-tyte Products. A few are illustrated herewith.

Information in regard to the uses of Hard-n-tyte materials will be supplied gladly and the opportunity to co-operate with architects and builders welcomed.

MASTER BUILDERS METALLIC CONCRETE HARDNER, dry mix integral hardener, water-proofer and dustproofer in standard gray and seven other colors, for use in either topping type method or Master Builders Monolithic Method.

MASTER MIX, liquid integral concrete hardener, waterproofer and dustproofer, colorless—functions completely at all low temperatures down to 15° F.

COLORMIX, integral concrete waterproofer and hardener, paste form, in nine basic colors.

"STAINPROOF", jellylike coating applied 36 hours after troweling, which dries to a tough impenetrable film, to protect surfaces of new floors and promote proper curing. Removed after curing period.

COLORWAX, for finishing Colormix floors.

DYCROME, colored "after treatment" hardener and dustproofer, in several unusual colors and tints.

DYCROME WAX, special wax for finishing Dycrome processed floors.

DYCROME STAINLESS OIL, special oil for finishing Dycrome floors exposed to weather or staining.

SANISEAL, colorless "after treatment" hardener and dustproofer.

MASTER BUILDERS WATERPROOFINGS, including:

Integral: Liquid (Concentrated); Powder; Paste; and Master Mix (for cold weather waterproofing).

Surface: Masterseal, colorless surface waterproofing; Mastertex, colored surface waterproofing in 10 colors; Metallic, to resist pressure.

MASTER BUILDERS DAMPPROOFINGS, including: Plaster Bond, an interior dampproofing; Foundation Coating, for exterior of masonry below grade.

Also manufacturers of Colorseal; Concrete Floor Enamel; Kilfreez, concrete freezeproofing; Speedit, concrete accelerator, and Master Builders Exterior Concrete Coating.

Description and Advantages of Masterbuilt Floors

In 1911 THE MASTER BUILDERS COMPANY instituted the principle of hardening concrete and produced the first concrete hardener. Since that time THE MASTER BUILDERS COMPANY has been supplying hardeners for concrete floors in practically every type of building—to serve under every sort of industrial or commercial process, to resist the wear of every kind of traffic or use.

Masterbuilt Floors are constructed according to definite, standardized principles, employing Master Builders Hardners of three general types:

Type 1—Metallic finish for new floors, using Master Builders Metallic Hardner, a water-absorbent, pure metallic granular element which is troweled into the surface of the new floor as it takes its set, producing a

Masterbuilt Floors
HARDENED CONCRETE

surface half iron, half cement. This type hardener is made in dark gray, red, buff, green, blue, brown, battleship gray and black.

Type 2—Integral method for new floors, using Master Mix, a liquid chemical which, added to the gauging water, is introduced into the mortar when it is being mixed, and that in one operation produces three qualities; increased resistance to abrasion, a non-dusting, and a waterproof floor. An adaptation of Type 2 is Colormix, the integral hardener, and waterproofer for producing concrete floors in various colors.

Type 3—Surface hardener (after treatment) for floors already installed, using Saniseal, a powerful chemical combination which is washed over the set surface of a finished floor. By the ensuing chemical reaction the surface is made dustproof and wear-resisting. A development of Type 3 is Dycrome, a colored liquid hardener which, applied to the surfaces of plain cement floors, both hardens and colors them through chemical reaction.

It is the policy of THE MASTER BUILDERS COMPANY to supply all three types or methods, basing their recommendation in each instance on the knowledge of what each type of hardener will do under the kinds of traffic under consideration. The soundness of this policy is evidenced by the general tendency of architects, engineers and builders today to provide the specific hardener or type of hardened floor required by the usage the floor will get. See table on next page.

Masterbuilt Floors, constructed by the integral topping method or the integral monolithic method, possess hard wearing, permanent, non-absorbent surfaces of maximum density to withstand conditions of extraordinary wear and tear.

THE MASTER BUILDERS COMPANY does not recommend that the surface or "after treatment" method be specified for new floor construction where it is possible or practicable to use integral hardeners.

Master Builders Metallic Concrete Hardner

This perfectly graded metallic aggregate is especially manufactured for mixture with the sand and cement used in production of concrete floors. As it replaces its own volume of brittle sand, it imparts to the aggregate its own metallic qualities: ductility, toughness, strength, permanence. Master Builders Metallic Concrete Hardner consists of water-absorbent, scientifically graded, rough, jagged particles that lock securely in the mixture. It is absolutely free of impurities and exactly uniform in every respect at all times.

Master Builders Metallic Concrete Hardner gives concrete a ductility, or elasticity which plain concrete does not have. This characteristic gives the Masterbuilt Floor a "give and take" that greatly lengthens its life under even the most severe service.

TABLE OF RECOMMENDATIONS FOR MASTER BUILDERS CONCRETE FLOOR HARDNERS

Showing which types of Masterbuilt hardened concrete floors should be provided to serve various kinds of traffic or use. These recommendations based on 15 years' experience with all types of hardeners on floors in practically all kinds of buildings.

These are general recommendations, subject to revision under special conditions, and are to be considered as final only after confirmation by our representatives who have investigated the job.

Explanatory Key to table:

1. Metallic hardened floor—topping type.
2. Metallic hardened floor—monolithic.
3. Master Mix hardened floor.
4. Colormix or Dycrome hardened floor.
6. Saniseal hardened floor.

3 and 6. Use Master Mix integrally, followed by Saniseal surface treatment.

Compressive Strength Tests—How the introduction of metallic hardener greatly increases the strength of the floor is demonstrated by tests made by the Robert W. Hunt Company's Pittsburgh Testing Laboratories.

SUMMARY OF RESULTS OF COMPRESSIVE STRENGTH TESTS

Age of concrete	Plain concrete*	Metallic hardened concrete*	Percentage of increase
3 days	3274	6927	111%
7 days	3626	8695	139%
28 days	6129	13245	116%
90 days	6583	14302	117%

*Pounds per square inch.

Master Builders Metallic Concrete Hardner is especially recommended for heavy duty floors; boiler rooms, trucking aisles, shipping platforms, loading docks and elevator approaches in all buildings; and for all floors in such structures as warehouses, railroad stations, forge shops, foundries, machine shops and industrial buildings generally.

Specifications for Master Builders Metallic Concrete Hardner

Topping Type Method of Floor Finishing

Preparation of Topping—Wherever practicable, topping to be laid before base is set. Topping (not less than full $\frac{3}{4}$ -in. thickness) shall consist of following proportions by volume: 1 part tested portland cement to 2 parts coarse, gritty, clean sand. Or, for rock or grit, specify as follows: 1 part tested portland cement; 1 part crushed rock or grit (not exceeding $\frac{3}{8}$ in. size) free of dust; 1 part clean, coarse, gritty sand.

Mixing—Sand and cement shall be thoroughly mixed dry until uniform in color, showing no streaks or patches of the constituents. If mixed by hand the mass shall be turned over dry at least three times. Sufficient water to saturate the mixture shall be added and the mix turned over once again. Special care shall be taken to avoid a sloppy consistency.

Application of Topping—The topping shall be laid and straightedged to a true and even surface, well floated to close all voids and hollows.

Application of Metallic Hardner—After the surface has been floated, but before steel troweling, a dry mixture of 1 part of Master Builders Metallic Concrete Hardner, to 1 part tested portland cement (by weight), mixed to an even color, shall be sprinkled evenly over the surface, using a sieve to get uniform distribution. Not less than 30 lbs. of Master Builders Metallic Concrete Hardner and 30 lbs. of tested portland cement shall be distributed in this manner over each 100 sq. ft. of surface. This shall be floated in thoroughly and troweled; a second steel troweling shall be given the surface when it has set sufficiently to finish hard and smooth. Under no circumstances shall the mixture of hardener and cement be applied when there is any surplus water on the floated surface.

Expansion Joints—Are recommended at regular intervals in all topping floors. Joints to be cut through the full thickness of the topping with narrow tool and edges to be hard finished.

Safeguarding the Floor—The green floor surface shall not be wet until it is 48 hours old. After the surface has set up 48 hours, the contractor shall cover it with a uniform layer of soft-wood sawdust, shavings or other suitable covering. This covering must not be applied until experiment shows sur-

face hard enough to prevent the covering from scratching or injuring the finish. Surface shall then be kept wet for not less than 5 days. Floors, when prepared as above, will be ready for light traffic in about a week, and for heavy traffic in about 3 weeks under favorable weather conditions.

Exceptions—The use of 30 lbs. of Master Builders Metallic Concrete Hardner to every 100 sq. ft. of surface provides a wearproof finish sufficient to withstand any normal usage.

For floors of factories, garages, loading platforms, etc., specify 35 lbs. of Master Builders Metallic Concrete Hardner to every 100 sq. ft.

For floors of railway repair shops, forge shops, piers, etc. specify 40 lbs. of Hardner per 100 sq. ft.

Master Builders Monolithic Method

The term "monolithic" is interpreted in various ways—and these various interpretations produce various results. Master Builders Monolithic Method is the proven method, by which the floor slab is poured, straightedged, finished and troweled in one operation.

Master Builders Monolithic Method should be definitely specified to secure a Masterbuilt Floor with the following definite results: (a) base and topping are one, with no danger of loose bond, cracking or breaking under service; (b) time, labor and material for extra topping saved; (c) dead weight of topping and necessity for expansion joints eliminated; (d) surface hardened with Master Builders Metallic Hardner resulting in the same great increase in wearing strength as in the topping type method.

Mixing and Placing Slab—The slab shall consist of a mixture of: 1 part tested portland cement, 2 parts coarse, gritty, clean sand, and 4 parts crushed rock (or 1: 2½: 5, when gravel is used). All aggregate to pass 1-in. screen. These materials must be thoroughly mixed; then deposited between screeds to the finished floor level (on heavy slab, exceeding 6 in. in thickness, $\frac{1}{8}$ in. allowance must be made for shrinkage). Thoroughly tamp and screed with straightedge, taking special care to leave no hollows, pits or pockets on the surface.

First Application Metallic Hardner—Shall immediately follow leveling off of concrete slab. A dry mixture containing 1 bag 100 lb. Master Builders Metallic Concrete Hardner, 2 bags standard portland cement, and 3 bags clean, coarse sand shall be thoroughly (dry) mixed and then distributed evenly (using a sieve) over approximately each 1000 sq. ft. of surface. This preliminary finish will immediately become saturated with the surplus water remaining on the surface; it must then be thoroughly floated into the concrete with heavy wooden floats.

Final Application Metallic Hardner—Immediately following the floating in of the preliminary finish, a dry mixture consisting of 1 bag (100 lb.) Master Builders Metallic Concrete Hardner and 1 bag (100 lb.) of standard portland cement, thoroughly mixed to a uniform color, shall be evenly distributed (using a sieve) over each 500 sq. ft. of the floated surface. This final finish must be floated in with wooden floats and immediately steel troweled, with a second steel troweling after surplus water has disappeared. Finished surface must be free from depressions or defects of any kind, presenting a smooth and even texture.

Curing and Protecting Floor—Sawdust or curing sand without grit shall be evenly distributed over the surface to a depth of not less than 2 in., as soon as the concrete has sufficiently hardened. This covering shall be kept moist for not less than 8 days. Contractor to provide sufficient canvas or other covering and heat, before work starts, to protect surface from damage in event of rain, frost, etc.

Master Mix

Master Builders Master Mix is a colorless liquid chemical admixture which is added to the gauging water to permanently increase the strength of concrete floors throughout the entire wearing course or topping.

The important characteristics of Master Mix are that it improves the workability and increases the density of mortar, introduces a hardening element and a waterproofing element, functioning regardless of temperature down to 15°. Specially recommended for winter construction of floors, brickwork and masonry.

Master Mix accelerates the final set of cement from 2 to 4 hours; increases the tensile strength 71% in the first 24 hours and from 10 to 20% permanently; increases the ultimate compressive strength from 10 to 13%. Master Mix has been in use for over ten years to produce Masterbuilt Floors that are wear-resisting, non-absorbent, dustproof and acid-resisting.

Compressive Strength Tests—How the introduction of Master Mix greatly increases the strength of the floor is demonstrated by tests made by the Robert W. Hunt Company's Pittsburgh Testing Laboratories.

SUMMARY OF RESULTS OF COMPRESSIVE STRENGTH TESTS

Age of concrete	*Plain concrete	*Master Mix concrete	Percentage of increase
3 days	2950	4051	37.3
7 days	3670	4066	10
28 days	4261	4806	12.7
90 days	6265	7046	12.6

*Pounds per square inch.

Master Mix Specifications

For Hardening Concrete Floors—1-in. topping shall be installed, proportioned 1 part fresh, tested, portland cement and 2 parts clean, coarse, sharp sand. Mix thoroughly, dry. Add Master Mix to gauging water, gradually, in proportion of 1 qt. Master Mix for every bag of cement used. Pour float and trowel cement in usual manner. A second troweling shall be given when surface is sufficiently set to produce a hard smooth finish. Protect surface from injury with not less than 2 in. soft wood sawdust or curing sand, and keep it wet until surface is hard.

See second page following for specifications covering use of Master Mix for waterproofing mass concrete and brick mortar.

Colormix

Colormix is an integral colored hardener for producing wearproof, dustproof, waterproof concrete floors in permanent colors, for use where decorative, hard type floors are desired and where money limitations prohibit the use of expensive materials such as tile, terrazzo, etc. Dissolved in the gauging water, Colormix dyes every particle of sand and cement in the entire topping a deep, uniform, permanent color.

Whereas ordinary coloring agents seriously weaken concrete, Colormix contains hardening elements which maintain the full tensile and compressive strength.

Colormix is made in the following colors: Tile Red, Linoleum Brown, Nile Green, White, Buff, French Gray, Black, Battleship Gray and Blue.

Uniformity, purity and permanence characterize Colormix, the color permanence of which has been tested and reported satisfactory by the Portland Cement Association.

Stainproof, used to protect the fresh surface from staining and marring and promote proper curing, insuring perfect finished results, is a new and invaluable feature available only with Colormix.

Specifications for Use of Colormix

Colormix Top Finish—A top finish of not less than 1½-in.

Master Mix
CONTROLS CONCRETE

Typical Gray Colormix Floors in John Wanamaker's New York Store Help to Attract Crowds of Shoppers and Withstand the Heavy Traffic

thickness shall be used on a set slab and not less than ¾-in. thickness shall be used on a green slab, topping to be composed of 1 part cement to 2 parts clean sharp sand.

Colormix can be used in the entire thickness of the top finish, but from the standpoint of cost, it is advisable to run the top finish in two layers, using Colormix in the top layer only. If two layers are run, it is simply necessary to scratch a layer of ordinary 1:2 top finish over the slab, leaving it ¾ in. below finished surface line. This must be followed immediately by the Colormix top finish.

To Mix Colormix Top Finish—If mixed by machine, first place a small quantity of water in the mixer and then throw in a shovelful or two of sand; then add the right proportion of Colormix as specified below. The above should be agitated by the mixer 10 to 20 revolutions, which dissolves the Colormix. Then add the balance of the batch into the mixer. Allow this total mix to be thoroughly mixed so as to assure a uniform and even color. Care should be taken that mortar is not mixed too sloppy.

If mixed in mortar box by hand, proceed as follows: procure a 1-gal. open top paint pail and a small spring scale. Dissolve the proper amount of Colormix for each batch in the pail first. Use this solution as the gauging water to hydrate the 1:2 sand and cement mixture in the mortar box. If additional water is required to get proper mortar consistency, add slowly and sparingly, making sure that a perfect and complete mix is secured.

Proportions of Colormix to Be Used—As each color of Colormix weighs differently per unit of volume, one color must not be confused with any other color. Colormix must be proportioned exactly to each bag of cement per the following schedule:

Color	Per bag cement	Color	Per bag cement
Tile Red	Use 12 lb.	White	Use 14 lb.
Linoleum Brown	Use 12 lb.	French Gray	Use 10 lb.
Battleship Gray	Use 5 lb.	Black	Use 10 lb.
Nile Green	Use 17 lb.	Blue	Use 17 lb.
Buff	Use 17 lb.		

Laying the Top Finish—Apply the Colormix Top Finish to the floor and straightedge, float and trowel in the usual manner. Hard trowel the surface a second time, when it begins to set hard, to a glossy smoothness.

Expansion Joints—Shall be cut through the full thickness of the topping, at intervals of not exceeding 6 ft.

Protecting the Finished Surface—Master Builders Stainproof, a specially prepared compound for protecting new floors, shall be applied to the surface wherever possible, 24 hours after final troweling is completed, without the previous use of water for curing the concrete surface.

However, where the absorbent nature of the base or fill causes quick drying out of the topping, the surface shall be kept wet with clear water for 3 days. On the fourth day, when surface moisture has disappeared, a heavy paintlike film of Stainproof shall be applied direct from the container over the entire surface.

This stainproof film shall be left to dry for 36 hours and shall not be removed until just before the floor is to be turned over for use.

Removing Stainproof Film—After the plastering, painting, labor, and other trades have finished and are out of the building, and just before the floors are to be made available for use, the Stainproof film shall be removed. *First*—cover a limited portion of surface with water (hot preferred) and let stand for 15 minutes. *Second*—remove by brushing or scraping any area of film spotted with plaster or paint droppings. *Third*—with brushes or squeegees remove balance of film on area moistened.

Proceed with a second limited area in same manner. When all debris is removed, the surface shall be mopped thoroughly with clear water, allowed to dry, and then polished, preferably with machine polisher.

Color Waxing the Floor—After the Stainproof film has been removed and the floor is again dry, the surface shall be given an application of Master Builders Colorwax of the same color as the floor.

Note to Architect: Include this paragraph in specifications where high gloss finish is desired.

Master Builders Dycrome

Dycrome is a chemical compound which, applied to concrete surfaces, produces by chemical reaction with the cement a variety of permanent, attractive tints and colors. At the same time, Dycrome hardens and renders the surface wear-resisting and dustproof. Unusual color results are obtained as the degree of chemical reaction between Dycrome and cement varies on different parts of the floor, giving a cloudlike effect that lends interest and distinctive character to the floor.

The colors include Flemish Oak, Weathered Bronze, Cordovan, Palmetto Green, Jade, and Nile Green, and various combinations of these colors in duo-tone effects.

Merits and Advantages—Dycrome can be applied to any unmarred plain cement floor that is clean, free from oils, greases and other foreign substances. This treatment is recommended for surfaces that were left as "plain cement" in the original specification, but which are later found to require a decorative finish. This is of material advantage to those erecting buildings to be occupied by tenants with varying requirements which cannot be incorporated in the original specifications, but must be provided before the tenants move in.

Complete Application Service—The Dycrome treatment may be applied by any capable contractor or workman, or on important jobs is made by or under the direction of Master Builders Service, Inc., a corps of experts specializing in Dycrome applications.

Specifications for Floors to Be Treated with Dycrome

All cement floor toppings to be treated with Dycrome shall be of proportions 1 part standard portland cement and 2 parts clean, sharp sand. Before the cement is added there shall be mixed thoroughly into the sand 2 lb. of hydrated lime for every bag of cement used. Cement shall then be added and mixed dry, then tempered with just sufficient clear water to make a workable mortar. No integral or surface hardeners or water-proofer, other than Dycrome, shall be used.

All surfaces shall be given 2 hard steel trowelings and shall be left uniformly smooth and free from trowel marks. Joints shall be cut throughout the full thickness of the topping, where and as indicated on plans, and shall be kept clean and unmarred by troweling. All special jointing or marking as indicated on plans shall be exactly followed. Under no circumstances shall retempering of surface be done by sprinkling water, nor shall any cement be dusted on surface.

Curing of Cement Surface—All cement floors to be treated with Dycrome shall be cured by spraying once or twice a day with water for 4 days. If this is not possible, floors shall be covered 48 hours after final troweling with 2-in. layer of clean sand which shall be kept thoroughly wet for a period of a week. No building paper, sawdust, earth or shavings shall be used to cover floor.

Protection of Cement Floor During Curing Period—Traffic shall be kept off floors for a period of not less than 4 days, and no heavy traffic shall be permitted until the Dycrome Process is fully completed. Drop cloths shall be used to protect surface from staining by paint, putty, oils, solder paste, marking by wire insulation, or any other damage that may result from other crafts working over the floors.

These floors to be treated with Dycrome shall be turned over to MASTER BUILDERS SERVICE, INC., or the Dycrome contractor, free from paint, grease, oil, scratches, mars, stains or other disfigurements which will in any way interfere with the Dycrome Processing or injure the final results.

The general contractor shall arrange to keep these areas free from interruption or trespassing during the application of the Dycrome treatment, and any surfaces that are injured by other crafts either before or after treatment shall be replaced or reconditioned at the expense of the craft responsible for the damage.

Special Finishes—Dycrome Wax—Interior areas are finished with Dycrome Wax, a special wax manufactured by THE MASTER BUILDERS COMPANY, to emphasize the color values of Dycrome Floors and give the floors a smooth, soft feel under foot like that of linoleum.

Dycrome Stainless Oil—Exterior areas or floors subject to moisture or staining are finished with Dycrome Stainless Oil, which will not stain nor turn white when wet, an exclusive advantage with Dycrome treatments.

Weathered Bronze and Cordovan Dycrome Floor, in the Studio of F. R. Walker of the Firm of Walker & Weeks, Architects, Cleveland, Ohio

Master Builders Saniseal

Saniseal is a corrective for concrete floors which have started to dust, crumble and disintegrate. Also a preventive of these conditions on new floors.

It is a liquid chemical preparation which combines with the lime in the cement, forming a new crystal that is exceedingly hard and wear-resisting. It changes the soft, porous surface to a flintlike hardness.

Saniseal is easy to use. No complicated dilutions or applications are necessary. Except where a floor is particularly porous, 1 gal. of Saniseal will cover approximately 100 sq. ft.

It does the work overnight in most cases, thus preventing delays.

Supplementary Literature and Samples

All products described in greater detail, in either concise data manuals suited for the architect, or more descriptive catalogues for the layman, all 8½x11 in., indexed and tabbed for A. I. A. filing. These booklets, as well as specimen blocks of concrete treated by each Master Builders Method and mounted on file-size boards, are sent without charge upon request.

SANISEAL

Master Builders Waterproofings and Dampproofings

Master Builders Waterproofing Liquid (Concentrated)—Added to the gauging water. Waterproofs by depositing insoluble, water-repellent coating. Increases colloid formation. Requires less water to complete hydration. Produces high initial strength.

Because its use is so simple and easy—the workmen merely adding it to the gauging water, which carries it to every part of the mix—complete, efficient results are insured. No extra labor needed for weighing out, dissolving or mixing; hence, nothing can be neglected to the detriment of the job.

Specifications—Master Builders Waterproofing Liquid, Concentrated, shall be added to the gauging water in the proportions of $\frac{2}{3}$ qt. of Waterproofing Liquid to each bag of cement in the mixture to be gauged. This requires 1 gal. per cu. yd. for 1:2:4 concrete.

Concrete shall be poured as dry as consistent with good practice, shall be placed in one continuous operation, and shall be thoroughly spaded to procure uniform density.

Special care shall be taken to clean and roughen the surfaces of previous pourings that have been set before placing additional concrete.

Master Builders Waterproofing Powder—An insoluble, water-repellent powder which coats cement particles, preventing seepage. Permanent insolubility insures permanent watertightness. Prevents the early evaporation of moisture, thereby increasing the colloid formation.

Specifications—Master Builders Waterproofing Powder shall be mixed dry with the portland cement in the proportions of 8 lb. of Waterproofing Powder to each barrel of cement 400 lb. used. This mixture shall be thoroughly stirred so that a complete and uniform mixture is assured.

This mixture of Waterproofing Powder and cement shall then be added to the other aggregates. The whole volume shall then be thoroughly mixed until a uniform color and mixture is obtained, before adding the tempering water.

Master Builders Waterproofing Paste—A white, concentrated paste which is dissolved readily in the gauging water and is carried to every part of the mass. Produces a stable, water-insoluble, water-repellent crystal, which coats cement particles, nullifying the capillary action.

In complicated formwork it is sometimes considered necessary to use an excessive amount of water to obtain proper flowability of the mixture; with Master Builders Waterproofing Paste less gauging water is required to give complete hydration and proper flowability. Increases colloid development, colloid swells to fill the voids thus giving double protection against percolation of water.

Specifications for Waterproofing Mass Concrete—To 6 lb. or three qts. of Master Builders Waterproofing Paste add 1 gal. of water, and stir to a smooth mixture.

Use this mixture, together with sufficient clear water (about 33 gal. additional) to hydrate 1 barrel (400 lb.) of cement and its corresponding sand and stone, which shall be in the proportions of 1 part cement, 2 parts sand, 4 parts stone.

Special care shall be taken to clean and roughen the surface of previous pourings that have become set before placing additional concrete.

Specifications for Waterproofing Cement Mortar—To 6 lb. or 3 qt. of Waterproofing Paste add 1 gal. of water and stir to a smooth mixture.

Use this mixture, together with sufficient clear water (about 16 gal. additional) to hydrate 1 barrel of cement (400 lb.) and its corresponding sand, which shall be in the proportions of 1 part cement, and 2 parts sand.

Master Mix—A colorless liquid chemical admixture, a combination concrete hardener and waterproofer, which is added to the gauging water. Refer to page A99, for description and functions of this product.

Specially recommended for winter construction of brickwork and masonry, as it improves the workability and increases the density of cement mortar, hardening and waterproofing the joint, doing so uniformly regardless of temperature down to 15° F.

Specifications for Waterproofing Brick Masonry—Mortar in which bricks are laid shall be 1 part cement and 2 parts sand. Mortar shall be tempered with water to which has been added 1 gal. Master Mix to each 10 gal. of water. Carefully grout each course of brick, taking care that all joints are filled with mortar.

Specifications for Waterproofing Mass Concrete—Master Builders Master Mix shall be added to the gauging water for mass concrete in the proportions of 1½ gal. of Master Mix per cubic yard of concrete.

Surface Waterproofings

Masterseal—A specially prepared transparent colorless liquid for waterproofing the exposed surfaces of brick, stucco, stone or concrete walls, where it is necessary or desirable to retain the original appearance.

Masterseal is a permanent treatment that renders the surface, including the mortar joints, waterproof by introducing a highly water-repellent element into the surface pores. The penetration is greater than that of the usual surface treatment. The treatment prevents dirt, grime, soot, etc., from becoming embedded in the pores and, as a result, makes cleaning of the surface easy.

Masterseal is manufactured from a solid hydrocarbon base which is acidproof and alkaliproof and insures permanency.

Applied in two coats. Specifications on request.

Mastertex—A waterproof cement-base coating that both decorates and waterproofs concrete, brick, stucco, and other masonry surfaces. Colors are White, Brick Red, Blue, Light Green, Cream Ivory, Light Gray, French Gray, Dark Gray, Brown and Pink.

Applied with equal success on exterior or interior surfaces. It can be applied to wet surfaces, such as moist basement walls, fresh stucco, fresh reinforced concrete or surfaces of tanks, vats, pools, etc.

Mastertex takes a set like that of concrete, forming an insoluble, non-porous, crystalline coating which, unlike oil paints, is not affected by extreme weather conditions nor by any of the elements in the concrete. Does not dry out to a chalky, dusty coating; does not wash or rub off. An ideal white coating for common brick houses.

By excluding air and moisture from reinforced concrete both Mastertex and Masterseal prevent cracking or spalling due to the corrosion of reinforcing metal and overcome this common form of disintegration which is both difficult and expensive to repair.

Specifications—Master Builders Mastertex shall be applied in 2 coats to all surfaces as indicated, and shall be mixed and applied exactly in accordance with the manufacturers' directions.

Metallic Waterproofing—A perfectly graded uniform metallic powder used on outside or inside face of concrete or other masonry surfaces to make them impervious to water, even under pressure. Its use varies with the conditions to be remedied.

Specifications and Data—On request.

Dampproofings

Master Builders Plaster Bond—For application to the inside of exterior walls. Prevents dampness from passing through exterior walls into the atmosphere of the rooms and prevents staining and discoloration. Forms a perfect bond between surface and plaster coat.

Foundation Coating—For coating exterior walls below grade. Semipliable, yielding to expansion and contraction without breaking, checking or peeling.

Specifications for the Use of Plaster Bond and Foundation Coating—Master Builders Plaster Bond [Foundation Coating] shall be applied to all surfaces indicated, strictly in accordance with the manufacturers' directions.

THE WHITE COMPANY

Manufacturers of Floor Hardeners, Waterproofings and Technical Paints

GENERAL OFFICES

E. Biddle Street Extended
BALTIMORE, MD.

FACTORY, ORANGEVILLE, MD.

Products

WHYTEX, a Liquid Concrete Hardener for making concrete floors as hard as granite, eliminating dusting, sanding and wearing.

XLERATOR, a Liquid Chemical to hasten set of concrete, to prevent freezing of concrete, stucco and mortar at low temperatures.

HYDROLOX No. 267 DAMPPROOFING COMPOUND for foundations, walls and footings.

HYDROLOX No. 230 PLASTER BOND for dampproofing inner surfaces of exposed walls.

HYDROLOX No. 279 COLORLESS, a transparent liquid waterproofing.

HYDROLOX INTEGRAL PASTE for waterproofing mass concrete.

HYDROLOX POWDER.

WHYTOL, a Preservative for prolonging the life of wooden floors against dry rot, splintering and decay.

WHYTECOTE, a Mill White Coating made in gloss, flat and eggshell finishes for all surfaces.

Also Technical and Industrial Finishes for all purposes.

Service

For engineers, contractors and owners we maintain a staff of waterproofing engineers. They will be glad to co-operate with you, and furnish you with any information without obligation.

Whytex

For concrete floor hardening and dustproofing. A liquid chemical which penetrates deeply into the concrete floors, and through its chemical action, hardens, dustproofs and oilproofs floors. Concrete floors treated with Whytex resist wear and disintegration.

Covering Capacity—1 gal. of Whytex covers between 70 and 100 sq. ft., depending on texture of floors.

Whytex Specifications—All concrete floors to be hardened and dustproofed with Whytex as manufactured by THE WHITE COMPANY, Baltimore, Md., in accordance with directions of manufacturer.

Xlerator

For accelerating the set of concrete and to prevent the freezing of concrete and mortar. Xlerator is a colorless chemical which is added to gauging water. It gradually raises the temperature of water and secures a more complete crystallization, thus making a better and denser concrete. When added to floor topping, it produces a smooth, easy working mass, much denser than ordinary concrete. Valuable time can be saved in the setting of concrete by using Xlerator.

Hydrolox Dampproofing and Waterproofing Compounds

Hydrolox Integral Waterproofing is made in liquid, paste and powder forms, as follows:

Hydrolox Integral Paste—For waterproofing mass concrete in swimming pools, boiler pits, etc.

For mass concrete 1:2:4 or 1:2½:5, mix 1 gal. Hydrolox Paste to every 34 gal. water.

For cement floors, mortar or stucco 1:2 or 1:2½, mix 1 gal. Hydrolox Paste to 17 gal. water.

Hydrolox Powder—Especially adapted for cast stone, cement blocks and work where minimum water is required.

For all work mix dry 2 lb. powder with each bag cement or 8 lb. per barrel.

Hydrolox No. 267 Dampproofing Paint—For waterproofing and dampproofing, foundation work, footings, pits, etc. Apply cold with brush.

Covering capacity, 90 sq. ft. per gal.

Hydrolox No. 230 Plaster Bond—This product serves the purpose of plaster bonding and dampproofing the inner surface of outside vertical walls. Apply cold with brush.

Covering capacity, 90 sq. ft. per gal.

Hydrolox No. 279 Colorless—A transparent, pore-sealing liquid for waterproofing exposed brick, concrete or stucco walls without affecting or changing color. Eliminates moisture and dampness. Apply with brush or spray gun.

Covering capacity, 250 sq. ft. per gal.

HYDROLOX
TRADE MARK

Whytol

Whytol Wooden Floor Preservative prevents dry rot, splintering and decaying. Resists wear on new hard or soft wood floors, and prolongs the life of old floors. Gives an eggshell gloss finish and lasts for years. One coat is sufficient for new floors; 2 coats for old floors.

Covering capacity, 350 sq. ft. per gal.

WHYTOL
TRADE MARK

Whytecote

Whytecote Mill White Coating in gloss, flat or eggshell finish is especially adapted for industrial plants to withstand hard usage and give long service. Can be applied to any surface. Makes a nonporous film which can be washed with soap and water without any effect to the coating. Reflects all the light. Makes industrial plants more sanitary and efficient.

BUILDING CHEMICALS CORPORATION

Manufacturers of BriXope

51 East 42nd Street
NEW YORK, N. Y.

BriXope

BriXope is a liquid that cleans, removes efflorescence and waterproofs brick surfaces *in one hanging of the scaffold*. It is a balanced formula containing no acid; is slightly alkaline. It is clean, colorless in appearance and effect, and leaves no impurities within or without the brick or mortar joint. Shipped in 55-gal. drums and 5-gal. cans.

Removing Efflorescence—BriXope removes the actively efflorescing salts on the surface of the masonry. BriXope forms an insoluble waterproof film on the *inside* of the surface of the brick, breaking the capillary force and preventing ingress of rain water to form further stain.

Cleansing—BriXope removes any ordinary stain occurring on the masonwork. The moisture remains in the brick for several days. It dries thoroughly, and the full tone of the texture of the masonry appears, clean and free of dirt.

Waterproofing—BriXope fills crevices that form at the mortar joints. If these are too small to point, the BriXope should be allowed to run into the crevices, and it will waterproof thin hairline cracks.

BriXope versus Acid Cleaning

In using acids for cleaning brick surfaces, the destructive action of the acid must be considered. It acts on the lime of the joint (making the surface more porous), and stains surrounding surfaces, such as limestone, marble, etc., and causes corrosion of copper flashing.

BriXope, on the contrary, is slightly alkaline and will not injure limestone, marble (and other building stone) or copper flashings. It has no destructive effect on building materials—in fact, it deposits a protecting film on the inside surface.

Application

With hammer and a dry fiber brush remove, without wetting, as much as possible of the salt stain, mortar lumps and other dirt.

Scrub the surface of the brick and the mortar joints with the ordinary scrubbing brush and BriXope, *going over each spot twice*, until the BriXope is absorbed and runs white into the joints. Soak well under parapets and sills, under projecting courses of brick, and in any other places where there are moisture pockets. Scrub well spots showing marked efflorescence or stain, and continue scrubbing until all discoloration disappears.

BriXope is best applied when the wall is dry and warm. The greatest absorption of material and the best results are then obtained. It is unnecessary to wash with water after application.

Covering Capacity; Cost

On hard-burned best grade brick, cast stone or best grade cement brick, 1 gal. of BriXope will average 125 sq. ft. of surface. Do not take out the openings. For common brick, textured face brick, etc.,

estimate 100 sq. ft. per gallon.

BriXope does not raise the cost of cleaning a wall 10%. It is easy to apply properly, enhances the beauty of the wall, and preserves the surface. The cost is about 1¢ per sq. ft.

Specifications

Clean down face brick and other masonry with BriXope as manufactured by BUILDING CHEMICALS CORPORATION, 51 East 42nd Street, New York, N. Y.

Scrub over and wet each spot at least twice in accordance with manufacturer's instructions.

Efflorescence

The chemical composition of common forms of efflorescence is usually calcium and magnesium sulphate, with potassium and sodium sulphate also often appearing. Of this group calcium sulphate (plaster of paris) is almost insoluble and is usually the discoloration that appears on the older buildings long after the more soluble salts have been weathered off by continuous rains. The salts commonly found in the bricks themselves are sodium and potassium chlorides.

Metallic pyrites, when present in the clay, separate under the heat into sulphur and metallic combinations. The sulphurous gases generated in the art of brickmaking form ferric and aluminum sulphates.

Nearly all portland cements contain sulphuric anhydride in quantity between 1% and 2%, by volume.

The liquid from the wet mortar (concentrated mixed salt solution) is absorbed largely into the dryer brick.

Alternate drying and wetting, heat and cold, bring the salts to the surface in order of their solubility.

Service and Guarantee

Cleaning a Brick Wall
The left side shows the finished surface

Where tests are to be made for efflorescence, the architect submits for our analysis a sample of the brick, cement, sand, lime and all other ingredients that go to make the wall surface; integral waterproofing or admixtures of any kind must be included. We require at least three weeks to test these samples for salts and sulphates. No guarantees are authorized unless samples are tested in our laboratories.

CONCRETE SURFACE CORPORATION

"Surfacing Concrete for Bond or Appearance"

342 Madison Avenue
NEW YORK, N. Y.

FACTORY AT CLEVELAND, OHIO
REPRESENTATIVES IN PRINCIPAL CITIES

What Con-Text Does

Con-Text makes possible the sure and economical removal of the surface layer of cement and sand and so gives to concrete a surface of cleanly exposed coarse aggregate for either appearance or bond.

What Con-Text Is

Con-Text is a quick-drying liquid applied either to forms or to the surface of fresh concrete. During the hardening of the concrete it keeps from setting the surface layer of sand and cement to a predetermined depth. This unset material is readily removed by wire brushing either when the forms are stripped or in the case of horizontal surfaces in from 24 to 36 hours after placing.

Con-Text neutralizes and renders non-setting a surface film of cement only. The action stops entirely at the predetermined depth and there is no partially unset material.

Con-Text has no action on concrete that has already hardened.

Types of Con-Text

There are three types of Con-Text and these have different strengths.

(1) **Standard or Form Con-Text**—Applied to wood, metal or other types of forms. This is manufactured in four grades—Light, Medium, Heavy and Bonding.

(2) **Top Surface Con-Text**—Applied directly to the surface of freshly placed concrete. This is also manufactured in four grades—Light, Medium, Heavy and Bonding.

(3) **Stucco Con-Text**—Applied to the surface of freshly troweled stucco to reveal the aggregate.

How Con-Text Is Used On the Job

Standard or Form Con-Text—This is applied with brushes in a single uniform coat to the forms. It dries quickly and need only be protected against severe weather conditions. On stripping the forms the unset material is readily removed by brushing.

Top Surface Con-Text—This material is applied directly to the surface of the concrete before it has taken its final set. In small areas it can be brushed on, and in larger operations applied with hand or power sprayers.

At from 24 to 36 hours the unset material is brushed off with brooms.

Stucco Con-Text—For revealing the aggregate in exposed aggregate stucco. Before the stucco has taken its final set the Con-Text is applied with brushes or sprays. At from 24 to 36 hours the unset material is removed by brushing.

Uses for Con-Text

Standard or Form Con-Text—(1) For exposing the aggregate for appearance on such work as complete

exteriors; bridges; spandrels; basement walls; belt courses; retaining walls; parapet walls; coping sills; lintels; fences; decorative walls; precast walls, etc.

(2) For bonding surfaces to secure a cleanly exposed stone surface for the application of stucco, plaster, tile, brick, cork or

other materials.

For the bonding of all types of applied waterproofing.

Top Surface Con-Text—(1) To expose the aggregate in pavements, sidewalks, roadways, etc., to improve the appearance and prevent slipping.

(2) For exposing the aggregate to provide permanent bond for cement, bituminous or other top coatings and new to old concrete.

Ceiling at Garden City High School Prepared for Plaster Bond with Con-Text

STARRETT & VAN VLECK, Architects
STATEN ISLAND CONSTRUCTION CO., Contractor

Specifications for the Use of Con-Text

All concrete surfaces indicated on the plans shall have the aggregate exposed for bond (or appearance) by the use of Con-Text as manufactured by the CONCRETE SURFACE CORPORATION, New York, N. Y. Form Con-Text of the proper grade shall be used on surfaces in contact with forms and Top Surface Con-Text of the proper grade for direct application to concrete surfaces.

At the proper time, the unset material shall be removed by brushing and the surface cleaned by flushing with water.

Con-Text shall be applied and used in strict accordance with the manufacturer's instructions.

minimum of labor. One man with a Berg can do the work of four rubbing by hand.

In addition, the Berg cuts through the outer surface to expose the aggregate, and produces a surface that forms a perfect bond for float or other finishes. It is also ideal for producing special finishes on synthetic and imitation stone and concrete building block, for cutting brick walls preparatory to stucco application, and for grinding paint from bricks.

simple construction that any inexperienced workman may quickly become expert in its operation. All parts are guaranteed against defects, made of the finest materials and skillfully assembled.

Leading architects specify the Berg. It has been used with most gratifying results on every kind of concrete construction, including buildings, bridges, walls, culverts, dams, foundations, power plants, stadiums, etc.

Wilshire Boulevard Christian Church, Los Angeles, Cal.

A beautiful example of poured concrete construction. Entire structure surfaced by the Berg. An unusual and fine finish was produced without applying any other material

The Berg Regular Concrete Surfer and Finisher

Furnished for either 110 or 220 volts. $\frac{1}{4}$ hp., General Electric, Universal motor. Speed, 3200-3500 r.p.m. Total weight, 23 lb.

BAKER REMOVABLE WOOD JOIST FORMS.
Also Reinforcing Steel Bars; Spiral Column Reinforcement; Bar Spacers; Electric Welded Fabric; Metal Lath; Cold Rolled Channels.

Facilities and Service

An engineering organization, established in 1910, places seventeen years' experience in concrete design and forming at your disposal. A competent force of field engineers is backed by a large engineering department in our main office, to aid in solving your problems in design and forming.

Our bids include the complete forming (erection and removal) of the ribbed slab (concrete joist) construction, including slabs, joist sides, soffits, and shores, complete from beam to beam. The work handled by our men is indicated by the shaded portions of the details on the following page. If preferred, we also include column, beam, and miscellaneous forming in our bid.

A booklet with half-tones of a hundred structures of a wide range of types, erected with the aid of Baker Removable Wood Joist-Forms, will be sent upon request.

Special Features

Wide Range of Adaptability—Every condition, from light loads of hotels to heavy loads of special warehouse design, can be economically met—joist spacing, width and depth of joists, end conditions—all can be varied at will. These forms have been used in many:

Clubs	Garages	Factories
Hotels	Residences	Theaters
Apartments	Warehouses	Office buildings

Forming the Guaranty Building, Indianapolis, Ind.

Note the tonnage stored directly on our forms—possible only with a solid unyielding pan of wood

Solid Working Areas—The unyielding surface of these forms permits the trades to work without fear of crushing or displacing; shows a saving in the cost of placing steel, pouring concrete, attaching inserts, etc. Being of wood, this forming allows easy placing of outlet boxes, sleeves, etc., with the assurance that they will be found where they were placed when the forms are stripped.

Minimum Wastage of Concrete—The cost of leakage through most types of forming is considerable.

Not only the cement and labor cost, but also cost of pointing the resulting honeycombed joists, removing leakage from the floor below by chipping or scraping, etc., are items of real expense to the contractor. The design of our forms reduces the leakage to a minimum and practically eliminates honeycombing.

The Time Element—A specialized service organized for speed will work to your progress schedule. *We have yet to delay our first job.* We co-operate with and keep ahead of our customer's organization.

Low Cost—These advantages, together with patented features of our forming system, produce a lower cost than can probably be equalled by any other ribbed slab-forming materials, either of the permanent or removable type, where floors are reasonably typical. We do not show so large a percentage of saving where there is little duplication in the forming.

Hollywood Beach Hotel, Hollywood, Fla.

Interior showing excellent results obtained in decorated exposed concrete joists

Exposed and Decorated Concrete Joists

The joists are left exposed in buildings of many kinds, but always for one of two purposes—to save the cost of ceiling construction or for the architectural effect. In either case, clean lines and smooth surfaces are essential to good appearance.

Wavy and irregular soffits or joist sides; projecting humps of concrete on the underside of joist or slabs; ridges, indicating where pans were lapped or butted; all such deformities are objectionable in factory or garage—they are positively impossible in hotels, theaters, apartments, and residences where the exposed joist is used for decorative effect.

Crooked joist lines are eliminated and smooth finished concrete soffits are easily available to the designer who uses Baker Removable Wood Joist Forms. One of our patents covers use of mouldings forming the poured concrete at angle of joist and underside of slab.

To Specify

The forms for the ribbed slabs shall be Baker Removable Wood Joist Forms. They shall be oiled with a light paraffin oil before being used. Before pouring concrete the forms shall be thoroughly wet down with water. Forms shall be so constructed that they can be removed without disturbing shoring.

Note: For more detailed information, call at our nearest office. An engineer will respond promptly.

Berloy Steel Floor Cores

CANTON, OHIO

For Branches, see page A559

Products

BERLOY FLOOR CORES, FLOOR CORE END CAPS.

For Metal Ceilings, see page A559; for Metal Building Material, see pages B1286-1289; for Lockers and Shelving, see pages B2096-2097.

Use and Design

Berloy floor cores are metal forms for the construction of continuous slab T-beam concrete floors in steel or concrete framed buildings. They are made in such wide range of styles, sizes and weights that the construction can be adapted to any detail of design. End caps are made for use with all sizes and styles of floor cores.

Permanent Floor Cores

Berloy floor cores of the permanent type are usually made of No. 26 gauge metal and remain as a permanent part of the construction. Where this type is used, Berloy $\frac{3}{8}$ -in. Ribplex for the ceiling is first laid on the temporary shoring, and the forms on the Ribplex.

Attachment of Lath with Removable or Permanent Cores by Means of Wires Placed Before Concrete Is Poured

Removable Floor Cores

These are made of No. 22, 20 or 18 gauge material and can be removed and reused several times.

Method of Shoring

This method of shoring permits the removal of the cores for further use as soon as the concrete has taken its initial set

Suspended Ceilings

Details for either permanent or removable floor cores

Special Floor Cores

Concrete joists formed by floor core construction are normally designed to be from 4 to 6 in. wide. To meet special conditions of load and shear Berloy single and double taper floor cores are provided in both permanent and removable types. The special width floor cores also meet special requirements.

Single Taper Floor Cores

These taper down from the normal width of 20 to 16 in. This increases the width of the joist 4 in. where it enters the concrete beam.

Double Taper Floor Cores

These taper in width from 20 to 16 in. and also 2 in. in height providing an additional 2 in. of thickness of slab at the top where it enters the beam.

Narrow Width Floor Cores

To complete a floor width where standard 20-in. width floor cores are not an exact multiple, standard depth floor cores, either permanent or removable, are made in several narrower widths, with end caps to fit.

25-inch Floor Cores

Wider spacing between joists sometimes provides a more economical design than is offered by the standard 20-in. cores; for such cases special cores 25 in. wide can be supplied. These will produce joists 29 to 30½ in. on centers instead of the standard 24 and 25½ in. on centers.

Sizes, Styles, etc.

Width—20 in. between sides at bottom is standard, 25, 16 and 12 are special. Single and double taper cores are 20 in. wide at one end and 16 in. at the other.

Length—36, 24 and 12 in. covering lengths are standard for Berloy floor cores. Tapered cores are made only in 36-in. length.

Depth—4, 6, 8, 10, 12, 14 and 16 in. are standard. Double tapered cores taper from standard height at one end to 2 in. lower at the other.

Gauge—No. 26 gauge steel is standard material for all permanent cores, Nos. 22, 20 and 18 gauge for removable cores.

Weight

The weights of the floor cores vary from 1¾ lb. per lin. ft. for permanent floor cores 4 in. high, to 6 lb. per lin. ft. for 14-in. removable floor cores. The floor cores are shipped nested, which simplifies shipping and storage problems.

Engineering Service

Berloy Engineers experienced in designing this type of construction are at the service of architects ready to assist with layouts, suggestions and estimates. An illustrated bulletin A.I.A. Form No. 4d3 with complete load tables and illustrations of erection data will be sent promptly on request.

THE GOLDSMITH METAL LATH CO.

Manufacturers of the Shurebond Unit System of Metal Tile for Reinforced Concrete Slab Construction

GENERAL OFFICE AND FACTORY
CINCINNATI, OHIO

Products

THE SHUREBOND UNIT SYSTEM of METAL TILE.

For Metal Lath, Inserts, Furring Channels, etc., see page B1298.

Services

Catalogues, specifications, dead loads, concrete quantities, instructions for placing and installing, and other information on request.

The Shurebond Unit System (Patented)

A system of concrete rib or joist construction, combining quality with economy of construction. Manufactured of materials of sufficient weight properly treated to produce not only lasting construction, but also sufficient strength to stand up without distortion while being installed and concreted. Particularly adapted to long spans. The type of slab construction to use for hotels, office and commercial buildings, loft buildings, school and institutional buildings, apartment buildings, garages, etc. A strictly reinforced concrete system that can be designed and figured.

Shurebond Tile, End and Lath Bottom Units

Shurebond bottom units are tacked to the forms.
Shurebond tile units are placed in lath bottom units—no nailing.
Shurebond end units wedge on tile units—no nailing.

Advantages of the Shurebond Unit System

Less dead load to carry a given live load—saves reinforcing, concrete, and forming, reducing size of columns, girders and foundations.

Speed of construction—reduces contractor's overhead, carrying charges on the investment, and produces quicker revenue from the building.

Simplest type of forming necessary—open or skeleton forming.

Ease of erection—can be placed by one man, no stripping of metal pans, domes or forms, no wire hangers, no furring required.

Maximum strength and rigidity—special analysis heat treated steel used for tile units, eliminating sags and bends without planking while under construction.

Flat, level ceilings that are integral with the concrete—when stripping forms, can not pull down, thus eliminating refurring. Sufficient weight of lath bottom units to insure rigidity and long life. As easy to plaster as wood lath.

No nails to clip before plastering.

Perfect alignment—assuring concrete joists of uniform width throughout entire length, as tile can not shift or spread while concreting.

A hard dense concrete—no concrete leakage, absorption or honeycombing.

No breakage—less storage, hauling and handling.

Simplicity of conduit installation.

Savings Effectuated by the Shurebond Unit System

Maximum concrete displacement.

Reduced cost of wood forming.

Lower cost of installation.

Reduced cost of plastering.

Shurebond Unit System Sizes

Standard width 20 in. at base.

Standard length 2 ft. and 1 ft. covering surface.

Standard depth 4 to 16 in., inclusive, varying 1 in. Beveled or tapered tile or both in 2-ft. lengths to any degree of bevel or taper within reasonable limits.

Flanged tile furnished where lath bottoms are not required.

Fill-in tile the same as above, but 12 in. wide at base.

Standard end units of sizes to fit various tile units.

While our standard width is 20 in., we make any width or depth of the Shurebond Unit System to meet any special proposition or any layout that an architect or engineer may consider economical.

The American Furniture Mart, Chicago

The largest building in the world. Shurebond Patented Unit System used throughout—completed and ready for plastering at the rate of one floor per week

CECO REINFORCING BARS; MEYER REMOVABLE FLANGE TYPE and ADJUSTABLE STEELFORMS, for Concrete Joist Floor Construction; CECO EXPANDED METAL LATH; CECONOMY RIB LATH; CECO HOOK HANGERS.

Also manufacturers of Ceco Round Column Forms, Column Spirals, Bar Chairs and Spacers, Triangle Mesh Reinforcement, Electrically Welded Fabric, Road Strip, Furring Channels, Corner Beads, Base Beads, All-steel Shores and Column Clamps.

Ceco Reinforcing Bars

Rolled only from new billet steel. The deformations or lugs are placed at right angles to the axis of the bar, thus assuring greater bonding value. Tested and approved by the Robert W. Hunt Company.

Description of Meyer Steelforms

Meyer Steelform Construction is a standard system that represents the highest type of concrete joist floor construction in present day use. It consists of rows of heavy gauge removable steel forms, separated by reinforced concrete joists, and covered by a thin slab of concrete. Metal lath furring beneath provides a flat ceiling for plastering.

Meyer Steelforms

Made of 16 gauge sheet steel, accurately shaped and reinforced. Extremely rigid, thus maximum re-use is secured.

Meyer Steelform Construction is most economical for buildings, with lighter loads and longer spans such as apartments and hotels, residences, schools, hospitals, office buildings, garages, light manufacturing buildings, etc. In this class of structure, dead weight of construction is a considerable factor in the total load, so that the saving in dead load effected by Meyer Steelform Construction affords a considerable saving in cost.

Meyer Steelforms are handled on a rental basis only. Ordinarily, the labor of installing and removing the steelforms by our skilled workmen is included with the rental charge. The economy in the re-use of Meyer Steelforms, on a rental basis, is readily apparent.

In building the formwork for the concrete joist floor, Meyer Steelforms are used as a mould for the joists and the intervening slabs; the load being carried by the joists in one direction to the supports. Continuous joists are produced by lapping the Intermediate Steelforms, and the ends of the rows of Intermediate Steelforms are closed with Endforms.

Ceco
AND
MEYER
PRODUCTS TRADEMARKS

Meyer 20 in. Wide Flange Type Steelforms

Meyer Standard Intermediate Steelforms furnished in 1, 2 and 3-ft. lengths. Meyer Special Intermediate Steelforms furnished only in 3-ft. lengths.

Meyer Straight Endforms furnished only in 5-ft. lengths, 10, 15 and 20 in. wide.

Single Tapered Endforms—Furnished in 3-ft. lengths, 6, 8, 10, 12 and 14 in. high and 20 in. wide at open end. Forms taper from 20-in. width at open end to 18-in. width at closed end. (See detail.)

Double Tapered Endforms—Furnished same sizes as single tapered except there is a reduction in depth of steelform of 3 in. from open end to closed end to form "T" on beam.

Plan Showing Application of Tapered Flange Type Endforms

Meyer 30 in. Wide Adjustable Type Steelforms

Meyer Adjustable Steelforms are made 30 in. wide and 16 in. in total height. There are no horizontal nailing flanges and the Steelforms are nailed to the sides of the wood joists soffits instead of on top of same.

Of 14 gauge metal, and without stiffening impressions of any kind, Meyer Adjustable Steelforms are rendered absolutely unyielding and rigid by the use of small angles riveted to the underside of the form. Thus joists neat and cleancut in appearance and of uniform width are produced.

Meyer Adjustable Steelforms are particularly recommended for open ceiling work. The neat and cleancut appearance of the joists, their uniform width and alignment, the spacing of the joists at about 3 ft. on centers, are all pleasing to the eye and produce a workmanlike job.

Plan Showing Application of Meyer 30-in. Wide Adjustable Steelforms

Sizes of Meyer 30 in. Wide Adjustable Steelforms—

Standard Intermediates are furnished 30 in. wide and 1, 2 and 3-ft. lengths. Special intermediates are furnished 20, 15 and 10 in. wide.

Straight End-forms are 1 ft. long. Tapered End-forms are 3 ft. long.

Plan Showing Application of 30-in. Wide Adjustable Steelforms

Ceco Self-furring Metal Lath

Furnished in black iron, corrugated, galvanized, cut from galvanized sheets; also in copper iron alloy grade and in pure iron grade. Weights: 3.4, 3.0, 2.5, and 2.2 lb.

Detail Showing Hook Hanger Ceiling Construction, Using Meyer Steelforms, Ceconomy $\frac{1}{4}$ -in. Rib Lath and Ceco Hook Hangers

Ceconomy $\frac{1}{4}$ -in. Rib Lath

Ceconomy $\frac{1}{4}$ -in. Rib Lath

This metal lath requires 20% less plaster than ordinary metal lath. It was designed as a result of the demand for a metal plastering base and a reinforcement; Ceconomy (1) prevents plaster cracks, (2) is fire resisting, (3) requires less plaster than other metal lath and (4) is absolutely rigid. Ribs $\frac{1}{4}$ in. deep spaced 1.2 in. on centers.

Formwork Detail for Meyer Adjustable Steelforms
Note simple centering required

Ceco Hook Hanger Ceiling Construction

Hook hanger ceiling construction (above) involves the use of special Ceco Hook Hangers and a rib lath when used in connection with 20 in. wide Steelform Construction. When used in connection with 30 in. wide Steelform Construction the use of 10 gauge galvanized wire hangers and $\frac{3}{4}$ -in. furring channels is also necessary to assure maximum rigidity. This construction provides a most economical lath ceiling, is strong and rigid, but must be brought up tight against the bottom of the joists. The elimination of channels, hangers, and pencil rods effects an economy in material and labor.

Meyer Flange Type Steelforms in Place on Open Wood Centering

Attached Ceiling Construction with Meyer Adjustable Steelforms

Attached Ceiling Construction with Meyer Flange Type Steelforms

Ceco Hook Hangers are made of No. 10 gauge galvanized wire. Bent to form hook $3\frac{1}{2}$ in. long with 2-in. hook. Parallel sides 1 in. apart.

Ceco $\frac{3}{8}$ -in. Rib Lath

Cut from open hearth steel; furnished painted. Also from pure iron or copper bearing steel. Ribs are $\frac{3}{8}$ in. high and spaced 4 in. on centers. Erected with lath side out. No channels or rods necessary. Packed 9 sheets to bundle, nested and shipped uncrated.

Attached Ceilings

Our standard attached ceiling constructions used in connection with 20 in. wide and 30 in. wide Steelform Construction involves the use of galvanized wire hangers, steel furring channels, $\frac{1}{4}$ -in. round steel pencil rods and metal lath.

Note: The use of $\frac{3}{4}$ -in. Ceconomy Rib Lath spanning 24 in. on centers between the furring channels instead of the $\frac{1}{4}$ -in. round pencil rods and flat lath is equally recommended.

This construction may be brought tight up against the bottom of the joists or suspended as much as 6 in. The ceiling is erected after the removal of the Steelforms, and can be leveled up, straight and true, despite any variation in the level of the floor construction without filling out with plaster afterwards. The concrete and plaster do not come in contact.

This type of ceiling construction may be dropped a short distance below the bottom of the joists in order to conceal automatic sprinkler pipes or other conduits.

Ceco Service

Our Sales Department is technically trained, and each member is always ready to assist consulting engineers, architects and contractors with layouts and estimates for the reinforced concrete portion of building work.

Shipping Facilities

Complete stocks of all our products are maintained at all our warehouses listed on the preceding page. Meyer Steelforms are available at these points only. Prompt attention given every order large or small.

Handbooks

Handbooks describing all our products and their uses will be mailed on request. Much valuable information is contained in our latest edition, write for it. Please address our Omaha office.

GRID FLAT SLAB CORPORATION

761 Dudley Street
BOSTON, MASS.

Grid Flat Slab System

New and economical flat slab form of construction for floors and roofs, made upon removable steel domes. This method is a two-way rib section of reinforced concrete acting to support a lighter floor slab. By cutting out all useless concrete between the ribs there is considerable reinforcing steel and concrete saved. This saving of steel and concrete cuts the dead weight very materially and allows for wider spans and column spacings—bays have been constructed up to 32 ft. square.

The Grid Flat Slab System is designed under the same rules as the usual two-way flat slab of reinforced concrete floors.

Formwork costs are cut considerably by the use of steel domes and their necessity of only one-way support. When the steel domes are removed, after the setting of the concrete, the hollow squares left present a very pleasing and attractive appearance.

Harbor Building, Boston, Mass.
BLACKALL, CLAPP & WHITTEMORE, Architects
350,000 sq. ft.; 81 working days

Calculations of Grid Flat Slab—The calculations for the Grid Flat Slab are identical with those of the usual two-way flat slab. Standard specifications for concrete and reinforced concrete for flat slabs apply to Grid Flat Slabs.

These formulas are recommended for use where there are no definite building laws. Where architects or engineers design without set codes, the method taken with usual two-way flat slab designs can be taken with Grid Flat Slab.

Thickness of Slab and Depth of Dome to Be Used—The thickness of the Grid Flat Slab and the depth of the dome required for any structure is determined by the weight to be carried and the span or spacing of the columns. The same method of determining the thickness of the ordinary flat slab should be employed. The rule is that the slab should be $\frac{1}{2}$ of the column span. The depth of the dome plus the thickness of the slab above should usually be at least 1 in. greater than the usual flat slab. The slab should never be less than 2 in. on top of the dome the depth depending on the concentrated load.

Steel Domes—The steel domes are 2 ft. square from outside to outside of flange. The flanges are $2\frac{1}{2}$ in. wide cut square. The dome is 19 in. square. The flanges are butted on the wood understructure forming 5-in. rib, both directions. The domes are fastened to the wood forms by nails.

Wood Forms—Double stringers supported on uprights, by removable blocks, carry single stringers on 2-ft. centers. Lumber required approximately 2 ft. b.m. per sq. ft. of floor. Nearly all lumber is dimensioned timber and can be used many times.

Placing Reinforcing Steel—Reinforcing steel can not be misplaced or left out. The steel is placed, one or two bars in the ribs and the steel man can not misplace it or leave it out, by mistake, without it being noticed.

Inserts and Electric Conduit—All inserts and conduits can be placed in the Grid Flat Slab the same as regular slab. Outlet boxes in ribs, large junction boxes in slab. Inserts can be placed as desired and held firmly in place with a small

device. Floor drainers, if large, by leaving out a dome—extra concrete will support it.

Pouring of Concrete—The domes are No. 16 gauge steel. The tops are flat and stiff enough to support a runway to wheel concrete to point of placing. Screeds can be placed on domes to assure correct and equal thickness of concrete in placing.

Availability of Steel Domes—The steel domes for the Grid Flat Slab System are available in quantities large enough for any job and can be supplied on short notice.

Domes and System Patented—The steel domes for the Grid Flat Slab System as well as the type of construction are patented and the patents owned by the GRID FLAT SLAB CORPORATION.

Service

The engineers of GRID FLAT SLAB CORPORATION will advise, design, make all plans for use of Grid Flat Slab as well as contract to erect the system.

ESTABLISHED 1899

EDWARD A. TUCKER COMPANY

Contracting Engineers for Fireproof Floor Systems and Concrete Reinforcement;
Removable Metal Forms

Converse Building, 101 Milk Street
BOSTON, MASS.

REPRESENTATIVES IN HARTFORD and NEW HAVEN, CONN., ALBANY and UTICA, N. Y.

Products

DIAMOND DEFORMED BARS; SPIRALS.

FLOOR SYSTEMS: Metal Rib Long Span, Akme Flat Slab, Combination Tile.

Also, Marks System Gypsum Roof, Metal Frame Stirrup Units, Clips, Spacers, Chairs, Removable Metal Forms.

Services

This company offers, in connection with the sale of its floor systems, complete structural designs and plans; and the fact that the company is regularly retained as engineers by architects and contractors is a guarantee that the designs offered in the sales propositions will be conservative and reliable.

We lease our metal forms either with or without engineering services or sale of reinforcing material. Complete information showing application to any particular building furnished on request.

Reinforcement

Diamond bars—standard deformed bars rolled for us by the Jones & Laughlin Steel Corp., from new billet stock to standard specifications for reinforcing bars.

Shipments

Direct from the mill.

Mill Warehouse—from the most modern and completely equipped fabricating plant in the United States.

Boston Stock—warehouse at East Cambridge fully equipped with power machines for fabrication of all kinds, large stock, shipments at one day's notice.

Metal Rib Floors

Consist of reinforced concrete joists and slab, formed by removable metal pans or domes. This sys-

tem reduces the waste of form material to the lowest point, saves on the amount of concrete and reinforcement, and is adapted to all classes of work. For garages, manufacturing plants and unfinished buildings, open joist construction is used. For schoolhouses, hospitals, etc., a metal lath ceiling is attached to the ribs, giving a level ceiling. Note this feature—lath is put up after all concrete work is done, thus avoiding the wavy ceiling effect, the rusting and breaking of lath through long exposure and the uncertainty of the quality of concrete obtained.

We supply forms in 31 and 20-in. widths.

For exposed ceilings, the 31-in. forms increase the diffusion of light and give a much more pleasing ceiling effect than the 20-in. spacing.

Metal forms are of No. 12 gauge ($\frac{1}{8}$ in. thick) and because of this thickness a form as rigid as wood centering is provided, giving also true alignment of the ribs. The standard lengths of 6, 8 and 10 ft., will support the loads with shores only at the ends, thus reducing requirements for shores to one for every 25 to 30 sq. ft.

The long lengths also mean few laps, reducing to one-third this labor item if joints are specified to be smoothed up.

Lumber for false work in Metal Rib construction, including waste, is reduced to one and one-quarter board feet per square foot, or a saving of three-quarters to one board feet as compared with usual pan systems; the number of pieces in the lumber for false work is one-half that of other systems.

The quality of the work and the speed and economy of the construction depend on using a heavy gauge form.

Architects are requested to refer to us in specifications to provide definitely for bids on Metal Rib System.

Architectural Service

Our Fireproofing Department is organized to co-operate with architects and engineers in designing floor systems.

Send in floor plans and our engineers will submit designs for a Pyrobar floor system together with specific information, showing the advantages and economies obtained with the use of Pyrobar floor voids.

Pyrobar Floor Voids (Filler Tile)

Description—Made of "Structolite," a dense, specially prepared gypsum, in sizes 12 in. wide by 30 in. long, in thicknesses 3, 4, 5 and 6 in.; also, in sizes 19 in. wide by 18 in. long, in thicknesses of 6, 8, 10 and 12 in. The 19x18-in. voids are cast with one end integral thus providing a seal for each row at girders. Of this latter type, standard and fractional lengths with both ends closed, are furnished when required, at a small additional cost. Heavy deck type can be supplied when it is desirable to omit customary 2-in. topping of concrete.

Advantages—Easily handled. Rapidly and economically installed. No nailing required to hold in place on forms.

A saving in reinforcing steel and concrete is assured when this void is used because its light weight reduces materially the dead load carried by joists and girders.

Form work is reduced to a minimum, as 12-in. tile are placed 16 in. on centers with 4-in. joists and 19-in. units are placed 24 in. on centers, with 5-in. joists.

Spans up to 30 ft. are possible with this system where light floor loads are involved, such as in school buildings, hospitals, hotels, and similar construction. Tests show that concrete poured adjacent to this void is actually increased in strength. No waste of concrete by leakage.

Pyrobar Voids Line Up Readily and Stay Put without Fastening

Pyrobar floor voids act as a very efficient sound deadener, making them especially desirable for use in hospitals and schools. Used in roof construction, high insulating value tends to prevent condensation. By using joist facers between voids, a uniform plastering base is obtained.

Specifications for Pyrobar Floor Voids (Filler Tile)

The floor (and roofs) shall consist of the Pyrobar Floor Void System of reinforced concrete construction, as shown on the accompanying plans and all material and workmanship shall be in strict accordance with these plans and specifications.

The voids for the floor and roof construction shall be Pyrobar Floor Voids manufactured by the UNITED STATES GYPSUM COMPANY and shall be of sizes indicated on the drawings. The floor voids shall be accurately spaced to secure the exact joist widths shown. Pyrobar Joist Facers (if required) shall be laid directly on the forms between the rows of tile. Care must be taken to see that the exact length of joists as determined by the width of beam tee is maintained. In case this length is in odd feet and inches, the floor voids shall be sawed to fit.

Note: Joist facers may be omitted if desired.

Product

SCHUSTER HOLLOW TILE FLOORS.

Description

Schuster hollow tile floor construction is a combination of hollow tile and concrete reinforced in two directions.

The tile are 12x12 special design clay blocks, capable of resisting shearing and compressive stresses. They are an integral part of the slab and are held securely in position by the key of concrete which is forced into the cells.

Each concrete joist between the rows of tile in each direction is reinforced with a straight bar, resisting positive moment; and, where continuity exists, with a short straight bar over the support, resisting negative moment.

No temperature bars are required. No concrete is required on top of the tile.

Structural Feature and Economy

Small dead loads permit the use of small beams, columns and footings. This effects a saving in concrete and reinforcement in these members as compared with other types of construction.

Tile used in shear and compression provides sufficient shearing area at the ends of each joist, and eliminates the top concrete required by other floor systems as compressive area to develop the reinforcement. The tile is not a mere filler adding useless dead weight but is a structural member of the slab.

Load distribution equal to that obtained with flat slab construction is secured. Heavy concentrated loads distribute themselves over two or more joists in each direction. This means that substantially there is no such thing as a concentrated load with Schuster hollow tile floors.

Slab thickness from 3 to 7 inches less in depth than that required by a one-way type of construction permits a total saving often amounting to an entire story height of the building. This means a material saving in masonry, pipes, conduits, stairs, etc.

Openings in the slab are easily handled. In many cases, special framing is unnecessary.

Plaster applied directly on the tile requires 2 coats,

whereas plaster on mesh requires 3 coats. If an all-tile ceiling is desired, soffit tile are used.

Schuster Hollow Tile Floors with Structural Steel Beams and Columns

Schuster Hollow Tile Floors with Concrete Beams and Columns

Service

To aid architects and engineers in the design of Schuster hollow tile floors, an engineer will be sent to your office on request. He will be prepared to furnish complete design data, information regarding tests, and previous use of the system without any obligation being incurred on your part, and without expense to you.

Schuster hollow tile floors are a patented type of construction. We control the sale and use of the floors and our service to the architect and engineer consists in furnishing them with complete information necessary for the design, and furnishing the tile for the floors.

Products

TRIANGLE MESH and ELECTRICALLY WELDED WIRE FABRICS for CONCRETE REINFORCEMENT.

For Triangle Mesh, for Stucco Base, see page B1273; for Electrical Wires and Cables, see pages C2908-2919; for Wire Rope, see pages C3416-3420.

Uses

Triangle Mesh and Electrically Welded Wire Fabrics are used for the reinforcing of concrete floor and roof slabs, concrete walls and chimneys, arch construction, beams, columns, dams and retaining walls, water, sewer and culvert pipe, pavements and roadways, river revetment, silos, fireproofing steel framing, bridge floors, reservoirs, monolithic concrete sewers and stucco work.

Advantages of Wire Fabric Reinforcement

- (1) Provides even distribution of steel.
- (2) Reinforces in every direction.
- (3) Tension or carrying members accurately spaced.
- (4) Low cost of inspection.
- (5) Properly distributes over a large area stresses due to concentrated load.
- (6) Due to cold drawing, higher elastic limits and ultimate strengths with same quality of steel.
- (7) Continuous action from one end of the structure to the other.
- (8) Impossible to leave out or otherwise reduce the necessary steel if specific style number of fabric or area of steel is specified.
- (9) Perfect mechanical bond.
- (10) Easily handled and stored on the work.
- (11) Minimum cost of installation.

Grade of Steel

A reduction of the required sectional area of steel is safely accomplished, within limits, by the use of a higher tensile strength steel. This high tensile strength

may be secured by increasing the carbon content or by cold drawing of mild steel.

Cold drawing of mild steel produces a high ultimate strength and yield point, and the proportion of the yield point to the ultimate strength is increased to from 70 to 90%. Since the strength of a reinforced concrete structure, in so far as the reinforcement is concerned, depends on the yield point of the steel, the high yield point of cold drawn wire is of great importance.

Galvanizing

Triangle Mesh Reinforcement is furnished plain on orders unless otherwise specified.

American Electrically Welded Fabric is furnished plain or galvanized as ordered.

In general, the additional cost for galvanized fabric is not justified except in special cases where the steel will be inadequately protected, as in very thin slabs, etc.

Triangle Mesh Woven Wire Concrete Reinforcement

Triangle Mesh fabric is made from cold drawn mild steel having an ultimate strength of 70,000 to 85,000 lb. per sq. in. The longitudinal members are

Fig. 1. Triangle Mesh Wire Fabric Reinforcement

spaced 4 in., the diagonal cross wires either 2, 4, or 8 in. It is the only design of wire fabric having cross wires that assist the longitudinals in carrying the load.

*UNITED STATES STEEL PRODUCTS COMPANY.

For the light styles of fabric, the longitudinals consist of 1 wire; for the medium styles, 2 wires laid parallel; and for the heavy styles, 3 wires stranded. The sizes of the wires and the number per longitudinal are varied to obtain the desired cross-sectional area of steel per foot of width. Stranded longitudinals are used to reduce the stiffness of the finished product without affecting the tensile strength.

2	4	12	12	.052	.026	27.6
2	4	14	14	.030	.015	15.9

Other styles can be furnished on application.

Rolls: Standard lengths 150, 200 and 300 ft. For No. 2 gauge wires and larger, flat sheets only.

Widths: Multiples of the spacing of longitudinal wires up to a maximum width which varies with the size and spacing of the longitudinals. Approximate maximums 56 to 72 in. for 2-in. spacing, 84 to 96 in. for 3 or 4-in. spacing, and 96 to 120 in. for 6-in. spacing. All widths measured center to center of selva longitudinal wires.

Extra charge made for widths narrower than 40 in.

Finish: Plain or galvanized.

Tensile Strength: Standard, 60,000 to 70,000 lb. per sq. in.; 70,000 to 80,000 lb. furnished when ordered.

Weights—All above weights are based on a width of 60 in. measured from center to center of the outside or selva longitudinal wires.

Fig. 2. Electrically Welded Wire Fabric Reinforcement

Electrically Welded Wire Fabric Reinforcement

A square or rectangular mesh made from cold drawn steel wire electrically welded at the intersections of the transverse and longitudinal wires. Various combinations of spacings and sizes of wires can be furnished.

This material combines the same high quality of material and service that has given Triangle Mesh reinforcement its enviable reputation.

AREA OF STEEL AND THICKNESS OF SLAB REQUIRED FOR GIVEN SPANS AND LOADS

Bending moment= $WL^2 \div 12$. Center of steel $\frac{3}{4}$ in. above bottom of slab.

Reinforcement in each case is sufficient for the live load shown plus the weight of the concrete slab. Any dead load of the floor exclusive of the concrete slab should be considered as part of the live load shown here.

Maximum stresses: Steel=18,000 lb., Concrete=700 lb.

Note: If not restricted by building code to a stress in the steel of 18,000 lb., a stress of 20,000 lb. can safely be used for wire mesh reinforcement. For a steel stress of 20,000 lb. reduce the areas of steel shown in the table by 10%.

After hundreds of tests of actual slabs made by the Testing Laboratory of Columbia University, the City of New York prepared a code covering slabs having spans of 8 ft. or less and decided on the use of an empirical formula that is equivalent to assuming a working stress in the steel in the standard formula for reinforced concrete design of approximately 32,000 lb. per sq. in. Millions of square feet of reinforced concrete floors have been built in accordance with this New York code.

Live load per sq. ft. lb.	Span of slab, center to center of supports, ft.-in.

See tables on preceding page for styles of Triangle Mesh and American Electrically Welded Fabric that will give required areas.

Wire Fabric Reinforced Slabs

Supporting the Mesh Reinforcement—The correct location of the reinforcing mesh in the top portion of slabs over concrete beams can be easily and cheaply obtained by means of precast concrete blocks as shown in Fig. 3.

Fig. 3. Inexpensive Method of Supporting Wire Mesh Reinforcement Over Concrete Beams

Blocks should have a height about $1\frac{1}{4}$ or $1\frac{1}{2}$ in. less than the full thickness of the slab. The length may be any convenient amount such as 1 or 2 ft. or such lengths as are readily formed by breaking long strips of the blocks. The mesh should be supported for at least one-third of its width. These blocks will stay in approximately correct position without any means of attachment to the reinforcing mesh or to the forms.

For short spans (about 8 ft. or less) these blocks will be required on one side only of the beams. For spans greater than 8 ft., use blocks on both sides.

Detailing Widths of Mesh—For estimating purposes where accuracy is unnecessary, provided the estimate is on the safe side, it is permissible to assume that the mesh required will equal in square feet the actual

Fig. 4. Triangle Mesh Reinforcement As It Actually Appears with a Side Lap of 2 in.

area of the floor slab. As a matter of fact, the amount of mesh needed will be less than that, and at the same time a more efficient and more economical layout is possible. In the first place, a 2-in. lap along the sides of the sheets of wire mesh reinforcement is sufficient to develop the full strength of the reinforcement; more

Fig. 5. Electrically Welded Fabric As It Actually Appears with a Side Lap of 2 in.

than that is a waste of material. This 2-in. lap means a lap of the outside (or selvage) longitudinal wires and should not be assumed for those forms of mesh having a zigzag selvage edge.

A suggested detail for the amount and location of wire mesh reinforcement is shown in Fig. 6. Providing a short strip of light weight fabric is placed near the top of the slab over the girders with the main longitudinal wires at right angles to the direction of the girders, it is not only unnecessary but a waste of material to require that the main reinforcement of the slabs entirely cover the space between and over the girders. The distance between the center line of the girder and the edge of the reinforcing fabric can be any amount up to about 20 in. without reducing the strength of the structure.

Fig. 6. Detailing Widths of Mesh and Showing Extra Strip of Mesh Over the Girders

Other Uses of Wire Mesh Reinforcement

Concrete Joist Floors—Fig. 7 shows a typical section of such a floor. Here is a 2 or 3-in. slab having a clear span between the supporting ribs of 23 in., that must not only act as part of the compression portion of the beams and resist temperature stresses, but in addition act as a support of the loads that may come upon the floor.

Fig. 7. Typical Section of Concrete Joist Floor

The most efficient type of reinforcement to take care of these various stresses is a fabricated mesh made from cold drawn high elastic limit wire with comparatively close spacing of members.

Top Layer of Concrete Finished Floors—It is often desirable for construction reasons to leave the $\frac{3}{4}$ or 1-in. top dressing until after the main part of the slab is completely hardened. In this case the slab should be thoroughly cleaned before applying the final course, and this course should be reinforced with wire mesh reinforcement to prevent destructive cracks.

Specify Style 032 Triangle Mesh or 4x4-in. mesh No. 12 by No. 12 gauge wires Electrically Welded wire fabric.

Basement and Other Floors that Rest Upon the Ground—As conditions vary with each job, it is impossible to make any definite suggestions regarding the proper weight of fabric to use, but millions of square feet of Style 049 Triangle Mesh have been successfully used for this purpose. Where heavy loads and questionable fill-foundations occur, it will be economy to use heavier mesh, such, for instance, as Style 153 Triangle

Mesh or an equivalent weight of Electrically Welded wire fabric having spacings of wires that do not exceed 6 in.

Flat Slab Beamless Floors—Wire fabric reinforcement has been successfully used for this type of construction. It can be furnished in rolls or flat sheets.

This material is most desirable and it is highly recommended.

Cement Gun Work—Gunitite (trade-name) is concrete applied by the cement gun process, which produces probably the densest and, therefore, the most waterproof concrete available by present known methods.

Gunitite reinforced with wire fabric reinforcement has repaired successfully old crumbling bridge piers, tunnel linings and sea walls; old steel bridges, tanks and trusses; leaky reservoirs and irrigation ditches; even wooden structures that have been damaged by fire have been restored to usefulness by this method. And repair work is by no means the most important class of work produced. All kinds of new construction, especially those requiring waterproof qualities with light resulting weight, can be successfully executed.

Fireproofing of Steel Framing—Wrap all steel columns, girders and beams with Triangle Mesh, Style 032, or Electrically Welded fabric, 4x4-in. mesh, all No. 12 gauge wires.

Concrete Chimneys—Style 153 Triangle Mesh is standard for the circumferential reinforcement.

Stucco Reinforcement—See page B1273.

Concrete Sewers—The close spacing of members of Triangle Mesh is largely responsible for the successful results obtained with precast sewer pipe. The weight of fabric varies with the diameter of pipe, thickness of shell and depth of fill.

Concrete Driveways, Streets and Highways—Wire fabric reinforcement is essential to prevent destructive cracks. The purpose of the reinforcement is to increase the structural strength of the concrete slab and also to bind it together as a unit. The high tensile strength and the close spacing of members of a wire fabric show decided advantages for these purposes. The weight of wire fabric used in pavement has varied on account of varying conditions, but the average practice calls for 35 to 50 lb. per 100 cu. ft.

Suggested Specifications for Pavements—Reinforcement shall consist of steel wire fabric manufactured from cold drawn wire, finished members of which shall develop an ultimate tensile strength of at least 70,000 lb. per sq. in. and which shall bend cold 180° around a pin the diameter of which is equal to diameter of wire specimen without cracking on outside of bent portion.

All reinforcement shall be free from excessive rust, scale, paint or coating of any character which will tend to prevent proper bonding of the concrete.

The fabric reinforcement shall weigh not less than 40 lb. per 100 sq. ft.

The main or heavier wires of fabric shall be spaced not more than 6 in. apart. The secondary or lighter wires of fabric shall be spaced not more than 12 in. apart.

BARTON SPIDER-WEB SYSTEM, INC.

Reinforcing Steel; Manufacturers of the Barton Pan, Concrete Reinforcing Accessories and Metal Lath

TELEPHONES

LAFAYETTE 4142, 4143, 4144

3426 South Kedzie Avenue

CHICAGO, ILL.

Products

CONCRETE REINFORCEMENT: Round and Square Bars and Collapsible Column Spirals.

CONCRETE REINFORCEMENT DEVICES and ACCESSORIES: Combination High and Scream Chairs, Bar Chairs, Slab Bar Spacers, Joist Bar Spacers, Beam Bar Spacers, Concrete-to-brick Anchors, Concrete Inserts, Continuous Collapsible Stirrups.

BARTON PAN (with integral lath) and BARTON LONG SPAN METAL LATH.

BARTON NAILING STRIP, a Combination Nailing Strip, Sleeper Anchor and Floor Scream.

Concrete Engineering Service

The Barton Spider-Web System is the owner of U. S. Patents No. 1,335,780 and 1,217,645 covering the broad use of combination and two and four-way belts of rods in reinforced concrete flat slab construction.

The Barton Spider-Web System permits only its authorized licensees to incorporate this system in their designs. Infringers will be prosecuted.

We also furnish complete engineering services for any type of reinforced concrete construction, for a nominal fee, whether or not the Barton Spider-Web System is used.

Barton Spider-Web System of Reinforced Concrete Flat Slab Construction

The combination of two-way and four-way belts of rods in reinforced concrete flat slab construction covered by the above mentioned patents is altogether distinctive.

We license architects and engineers to employ the

Barton Spider-Web System in their plans for a very nominal fee. We do not license contractors or material dealers. Correspondence is invited.

Description of the System—The illustration shows the method of placing the reinforcing steel in the Barton Mat or Type A system.

Factory-fabricated units (or mats) consist of continuous looped bars with ends bent down so as to regulate the exact height of the unit and to act as spacers for the lower bars. One such unit or mat is placed in each direction over the column head to take care of the negative stresses. The positive stresses at the center of the span are taken care of by belts of rods extending from column to column, both directly and diagonally, covering the entire panel area and resting near the bottom of the slab. These rods are short and easy to handle.

Advantages of the System—Insures maximum economy of design because it makes possible larger effective depths in the slab.

The Barton Spider-Web System results in a flat, level ceiling without the use of beams or girders.

This permits light to be diffused over the entire ceiling and allows sprinkler heads to be economically spaced so as to save up to 25% of the cost of the sprinkler equipment. Trolley beams can be placed flat against the ceiling instead of being hung on beams and hangers.

Barton Pan for Reinforced Concrete Joist Construction

The Barton Pan combines joist, ceiling and floor construction. The bottom of the pan is formed into metal lath, the heaviest on the market, dipped after being punched and has special claws for holding plaster besides ordinary perforations. The Barton Pan is properly set—not inverted—instantly ready for plastering and floor finishing.

Simple in erection, easy and time-saving in handling; insures stiffness and rigidity. Top easily removable for installing pipes, conduits, boxes and anchorage means.

CROSS SECTION

Barton Spider-Web System of Reinforced Concrete Flat Slab Construction

Showing the mat or Type A system using fabricated mats over columns with four-way reinforcement in the slab

TYPICAL SECTION

An Extension to Joist Spacing to 36 In. or More Is Attained

Concrete and Steel Is Saved with the Key-shaped Joist

SECTIONAL PERSPECTIVE

Barton Pan for Reinforced Concrete Joist Construction

No concrete is damaged in removing forms. Joists are always straight, shores can be removed speedily.

Watertight construction insures hard concrete. The Barton Pan saves time, labor and materials. Can be used in rows of any length.

Made from special hard steel sheets, with deep corrugations.

The outstanding feature of the Barton Pan is its reduction of dead load through its key-shaped joist as against the present wedge shape. By this means, the Barton Pan can save 20 to 27% of concrete required by ordinary removable and permanent pan construction and a resulting saving in steel.

Specifications of Pan Construction—The system of concrete floor and roof construction unless otherwise shown on the plans shall be a combination of concrete joists with the Barton Pan with integral lath, complete with end panels where required, manufactured by the BARTON SPIDER-WEB SYSTEM, Inc., Chicago, Ill.

All tile to be standard tile where possible, with approximate right angle—Barton Bend—at all angles.

Tile shall lap adjacent tile and shall accurately fit into each other as provided.

At the end of each row of tile, where rows join girders or walls, provide Barton End Units, locking same into the last corrugations, not stretched.

The lath formation shall be dipped in a good paint after being manufactured.

Barton Deformed Rib Bars

Rolled from new billet stock open hearth steel and conform to the specifications of the Association of American Steel Manufacturers. Made in square and round deformed sections in sizes $\frac{3}{8}$ to $1\frac{1}{4}$ in., the corners of the square bars being rounded to prevent splitting of the concrete.

Furnished cut to length and bent at mill or warehouse. Large stocks for immediate shipment.

Square Deformed Bar

Round Deformed Bar

Barton Patented Collapsible Column Spiral

Coiled by machinery of special design (assuring uniformity of diameter) and assembled with the Barton patented link spacer.

Furnished in any length and in diameters of 10 to 38 in., inclusive; pitch, 1 to 4 in.

Carried in stock; immediate shipments assured

Barton Continuous Collapsible Stirrups

Shop fabricated and ready for the forms. No individual stirrups, chairs or wire to be misplaced or lost on the job.

Being one piece, it is easy to handle and requires little storage space.

Barton Continuous Collapsible Stirrup

Individual stirrups properly spaced and joined with the Barton patented tie rod become continuous collapsible stirrups. When so connected, the individual stirrups can not shift or change spacing.

At regular intervals, stirrups, specially designed to form legs, are placed. These support the other stirrups and the reinforcing bars at the proper distance from the bottom of the form. Chairs are integral.

Barton Nailing Strip

A combination nailing strip, sleeper anchor and floor screed.

This metal strip with its supporting unit (height in accordance with requirements) is simple to install. It is placed immediately after setting the metal forms and reinforcing steel and automatically acts as the screed for the concrete floor slab.

Floor sleepers may be anchored at any spacing desired by nailing to this strip. It may also be used where padding and carpet are placed directly above the concrete as in hotels and office buildings.

When placed in joist, beam, wall and column forms, it may be used for the installation of suspended ceilings, metal lath and wall furring and as an anchoring device for various purposes.

It makes possible the use of concrete lumber for fireproof partitions and other construction.

Barton Nailing Strip

Barton Combination High and Screed Chairs

Used for accurately locating and holding top reinforcing rods over column heads, over indirect bands in two-way flat slab construction and over beams and girders. Also used for supporting screeds in connection with floor slabs. Locking prong to hold bars in place, also wire and rail holes. Extra large seating area giving maximum strength. Carried in stock in all sizes from 3 to 9 in. high.

Barton Bar Chairs

Furnished in place of the Barton combination high and screed chairs, where the bars over column heads are only 2 or 3 in. in height. Made of strip steel and furnished for exact height as called for on steel plans.

Barton Concrete-to-brick Anchors (Patented)

These devices are used for bonding brick veneer, stone, terra cotta or tile wainscoting to concrete surfaces. They are nailed to the inside of the form and left in place when the latter are removed.

Barton anchors are economical because no expensive drilling through forms is necessary to install them and because they do not mutilate the forms.

Immediate shipments from stock.

Anchor Nailed on Form Preparatory to Pouring of Concrete

Anchors Left in Place Upon Removal of Forms

Barton Concrete-to-brick Anchors

Barton Key Slot Forms and Anchors (Patents Pending)

A system of metal forms that are removable from a key-shaped channel in concrete construction. With this system key-shaped anchors are inserted to fasten veneer of terra cotta, face brick, stone or any masonry to concrete after cement forms are removed.

Barton Key Slot Forms and Anchors

Barton Slab Bar Strip Spacer (Patented)

This strip spacer is well known and serves the same purpose as Barton slab bar spacer. It is made up special for each job.

Showing Bars Spaced, Supported and Tied on Barton Slab Bar Spacers

Barton Joist Bar Spacers

Designed to carry either one or two bars and are adaptable to any type of ribbed floor construction. Carried in stock and furnished in any width or height to meet the requirements. Made of strip steel, a combination of strength and durability.

Barton Beam Bar Spacers

Made from strip steel with a large seating area for each bar. Will not tip. Carried in stock and furnished for exact height and width of beam and number of bars in each layer.

Barton Patented Concrete Inserts

Barton concrete inserts are used in concrete slabs, beams or columns for attaching shaft hangers, pipes, fixtures, sprinkler systems, etc. They are made of special drawn wire and are so coiled that the threads of standard lag bolts will mesh with them.

Their carrying capacity has been demonstrated by many years use and by Robert W. Hunt tests. They are the lowest priced inserts on the market because no unnecessary material is used in their construction.

In 1/2, 5/8 and 3/4-in. sizes, with or without lag bolts. Stocked for immediate shipment.

Barton Concrete Insert—Lag Bolt in Place

Barton Long Span Metal Lath

A new style of metal lath. The unique feature is that it is made from steel sheets, with deep corrugations. The sides of the corrugations are punched to form talons or claws lying within the depth of the corrugations.

Barton Long Span Double Lath

The outstanding characteristics of the lath are:

Strength: made from special hard material for ceiling work, it allows a spacing of channel supports of 36 in. or more.

A true surface and minimum thickness of finished plaster work, as the outer surface of the corrugations provides a *rigid* and *perfectly level* troweling surface.

Economy: because the inner or back surface of the corrugations prevents more plaster being forced through than is necessary for a good key.

A good key and a good clinch, from the formation of the talons or claws between corrugations.

Spanning 36-in. centers, it eliminates intermediate channels and pencil rods, saving this cost and the time and labor cost of their installation.

CONCRETE CLIP & WIRE CO.

Manufacturers of Wire and Flat Steel Products for Building Construction

536-548 East 133rd Street, NEW YORK, N. Y.

Products

WIRE CLIP REINFORCEMENT for Concrete Fireproofing; HANGERS and HAIRPINS for Suspended Ceiling Construction; REINFORCING BAR CUTTERS and BENDERS.

Also Steel and Galvanized Mortar Boxes, Special Tools, Bridle Irons, Wall Ties and Ashlar Anchors.

Wire Clip Reinforcement

In order to prevent concrete fireproofing from cracking and falling off, wire clips are used on the bottom of structural steel members. They are manufactured in several styles, and the choice of style is a matter of personal preference.

Economy Clips—The Economy Clip (Fig. 52) has the longitudinal spacing member close up to the bottom of steel member to prevent interference with crosswise flow of concrete. The loops are under the flange, evenly spaced to provide adequate reinforcement. On extra wide flanges, two or more longitudinal reinforcing loops.

Fig. 52. Economy Clip

Fig. 51. Master Clip

Fig. 53. Individual Clip

Fig. 54

Master Clips—The Master Clip (Fig. 51) has the loops extending beyond the edges of flange of the structural member, thereby providing the reinforcing loops at the outside corners.

Master Clips Welded to Spacing Wire

Sizes—Both Master and Economy Clips are generally furnished electrically welded, 11½ in. apart, to a longitudinal spacing wire 5 ft. long; and packed 50 lengths (250 ft.) per bundle. This spacing may be varied to meet special conditions.

Either the Economy type, Master, or the clip shown (Fig. 54) may be furnished individually without being welded to a spacing wire. In this form they are used as concrete and brick wall ties.

White Clip—The White Clip is furnished in straight lengths and is zigzagged across the beam flange very much like lacing up a shoe. The advantages of this clip are that it grips the flange very tightly, as each clip pulls hard on its neighbors; the flow of concrete is assisted by the diagonal direction of the wires. The clips proper extend beyond the

flange reinforcing the corners of the soffit.

Hung Ceilings

Usual practice for hung ceiling construction calls for ¾ or 1-in. cross furring channels 12 or 16 in. on centers, depending

on type of metal lath used. These are fastened to main furring channels or angles, which are usually 4 ft. on centers, by means of wire hairpins which we manufacture in shape shown as Fig. 12. The top bend in Fig. 12 further reduces erection time on the job. Hairpins quickly and securely tie main furring and cross furring together more rigidly than loose wire.

Ceilings are usually hung from hangers embedded in the concrete construction or attached to structural steel or wood members.

Hanger shown (Fig. 21 usually called toggle hanger) is the standard type of hanger used for suspended ceilings in concrete construction. When wood joists, steel beams supporting wood construction, or other conditions are encountered, we manufacture various types of hangers to support the ceilings. Those shown below are typical.

Fig. 12

Hairpin

Fig. 21

Toggle Hanger

Fig. 27

Fig. 26

Hangers

Special Jobs—It is sometimes desirable to omit the main carrying or furring members. The hangers below are notched for either ¾ or 1-in. channels. Notice that some of these types are designed to hang from bottom of structural members.

Fig. 33

Fig. 34

Fig. 37

Fig. 36

Beam Hangers for Cross Furring

Typical Hung Ceiling Showing Use of Clips and Hangers in Construction

Economy Form Spacers

These are furnished to accurately space forms, giving an equal thickness of fireproofing at all points with a minimum of field labor. Made in sizes 1½, 1¾, 2, 2½ and 3 in.

Economy Form Spacer

Economy Bar Benders

No. 1 Bender will bend up to 1¼-in. round bars while the No. 2 is for smaller bars, up to ¾ in.

Engineering Departments

Experienced and efficient engineering departments are maintained in our district sales offices and will lend every assistance in solving all concrete reinforcement problems.

Havemeyer Concrete Reinforcement Bars

These deformed bars (Figs. 1 and 2) are rolled in square and round sections, with the deformations running longitudinally and entering directly into the tensile strength of the bar, no metal being used for the mechanical bond only. At all points they have constant uniform area of cross section exactly equal to the cross-sectional area of a plain bar of same size. Thus the purchaser secures all the advantages of a deformed bar with the same weight as a plain bar. He does not have to pay extra for the weight of the lugs.

As the projections and depressions are rolled longitudinally, there are no sharp angles to start a fracture when bar is bent. Tests prove the very superior bending qualities of Havemeyer bars.

Specifications for Steel—Havemeyer bars are rolled to any desired standard specification from new billet steel at mills which do not re-roll rails. This eliminates all possibility of substitution of inferior metal.

Shop Bending and Fabricating—Our warehouses are equipped for accurately bending and fabricating bars. This service eliminates a bending gang and bending machines on the job. Our warehouse charges for bending are less than it would cost the contractor if he did the work himself. Furthermore, shop bending assures the architect that every bar is bent accurately.

Fabricated units can be made up in our warehouses by using Havemeyer Beam-Saddles, Bar-Tys, etc., assuring proper spacing and placing of bars.

Mill extra for size per 100 lb. ...	Base	Base	Base	Base	Base	Base	10c	20c	20c	40c

Havemeyer deformed bars have a uniform area of cross section and the same weight per foot as plain bars.

Above standardized sizes recommended by the War Industry Board and adopted by the American Concrete Institute and by the Distributors of Reinforcing Bars.

Collapsible Column Reinforcement

Havemeyer Collapsible Column Spiral—Wire is accurately coiled to proper diameter and correctly spaced with a rigid spacer. Shipped collapsed, ready to be opened up and placed in the form.

Havemeyer Collapsible Columns—Havemeyer bars used for longitudinal members and for bands, the latter being attached to longitudinal members by Bar-Tys. Shipped collapsed for convenience in shipping and handling. Readily opened and set in place. These can be fabricated in our warehouses or by the contractor on the job. The use of Bar-Tys constitutes the cheapest method of assembling column steel.

Column

Securo Bar-Spacers for Supporting, Spacing and Holding Slab Reinforcing Bars

Made from hoop steel. Locking prongs and legs self-contained. Facilitate inspection—a missing bar is detected by its absence from the chair seat.

Fig. 5. Bar-Spacer

Standard height from underside of bar to form, ½, ¾ and 1 in. Minimum spacing between bars, 3 in. Booklet No. A8.

Havemeyer Bar-Tys for Tying Together Reinforcing Bars at Intersections

Used for tying together bars in walls, bent-up bars to supporting rods in slab, tying stirrups to beam bars, for fabricating columns, etc. More quickly attached than soft wire and much more secure.

Made from high grade spring steel wire in various sizes to accommodate any combination of bars.

Carried in stock.
Booklet No. A4.

Fig. 6. Bar-Ty

Havemeyer Ty-Chairs for Tying and Supporting Slab Reinforcing Bars

Quick, simple and economical. Made from high grade spring steel wire.

Standard distance from underside of bar to forms, 1 in.; special, $\frac{3}{4}$ to 2 in. Made in various sizes to accommodate any combination of bars used. Carried in stock. Booklet No. A4.

Fig. 7. Ty-Chair

One Ty-Chair used at each intersection on large bars and at every third intersection on small bars

Havemeyer Hy-Chairs for Supporting Head Rods Over Columns and Bent-up Bars in Slabs

Cheaper and better than concrete blocks. Made from pressed steel, beaded for strength and punched with locking prong and nailing holes.

Shipped nested. Easily carried and quickly distributed. Maximum size bar, $\frac{3}{4}$ in. Range in height from $1\frac{1}{2}$ to $8\frac{1}{2}$ in. Provided with nailing holes to insure retaining position in forms when concrete is poured. Booklet No. A8.

Fig. 8. Hy-Chair

Havemeyer Easel-Chairs for Supporting and Spacing Two Bars in a Joist

Used in terra cotta and steel tile construction. Made from high grade spring steel wire. Spring of locking arm securely holds bars in place. Single easel-chairs support one bar and both arms lock on the bar; double easel-chairs support two bars, one arm locking on one bar and the other arm on the opposite.

Standard distance from underside of bar to forms, 1 in.; special, $\frac{3}{4}$ to 2 in. Carried in stock. Booklet No. A4.

Fig. 9. Easel-Chair

Havemeyer Beam-Saddles and Separators for Supporting, Spacing and Holding Reinforcing Bars in Beams, Girders, Lintels, etc.

Saddles space and support lower layer of bars; separators space and support the upper layer.

Standard height from under side of bar to forms, $1\frac{1}{2}$ and 2 in. Made $\frac{1}{2}$ in. short of beam widths. Standard clear distance between layers, 1 in. Made from hoop steel. Locking prongs hold bars in position. Booklet No. A8.

Fig. 10. Beam-Saddle and Separator

Havemeyer Round Nose Curb Bars

Staggered and flared anchors act as reinforcement. Absence of continuous web permits accurate

and even bending without kinking. Stocked in 10 and 12-ft. lengths, galvanized. Booklet No. A6.

We also make angle nose curb bars for stair nosings and platform edges. Booklet No. A6.

Fig. 11. Round Nose Curb Bar

Security Anchor and Wall-Tys

Used especially for bonding brick veneer, stone, terra-cotta or tile wainscoting to concrete surfaces. Also used for holding metal lath ceilings and for anchoring floor screeds.

Anchor is made from hoop steel; Tys from steel spring wire. Standard length of anchors is 8 ft.

Fig. 12. Applications of Security Anchor and Wall-Tys

Concrete Inserts

Dayton Adjustable-Inserts—Made from highest grade malleable iron, cast in one piece with keyhole slot for adjustment.

No. 3 is for $\frac{1}{4}$ to $\frac{7}{8}$ -in. standard bolts; No. 5 for $\frac{3}{8}$ to $\frac{3}{4}$ -in. standard bolts, inclusive. Carried in stock. Booklet No. A7.

Fig. 13. Dayton Adjustable-Inserts

Havemeyer "Y" Socket-Inserts—Made from highest grade malleable iron. Broad nailing base with four nailing holes insures against displacement. Accommodate $\frac{3}{8}$ to $\frac{3}{4}$ -in. bolts with standard thread, both inclusive. Carried in stock. Booklet No. A7.

Fig. 14. "Y" Socket-Insert

Havemeyer Slotted-Inserts—Made from high grade pressed steel. Standard lengths, 12, 18, 24, 36 in. Accommodate $\frac{1}{2}$, $\frac{5}{8}$ and $\frac{3}{4}$ -in. bolts; $\frac{7}{8}$ -in. bolt special. Have 6 nailing holes. Closed slot and removable end caps prevent seepage of concrete to inside. Can be used singly, or, with end caps removed, can be placed end to end for a continuous run. Carried in stock. Booklet No. A7.

Fig. 15. Slotted-Insert

Havemeyer Safety Stair Treads ("SaniTread")

"SaniTread," a combination of steel plate and lead slugs, can be applied to any type of concrete stairs. Cut to required lengths in multiples of 3 in. Carried in stock. Booklet No. A6.

Havemeyer Metal Lath

An ideal base for ceilings, walls, partitions and exterior stucco work. A stiff heavy product made of

Fig. 16. Havemeyer Flat Lath

steel, plain or galvanized, or of pure iron, especially well suited for overcoating or long spans.

WEIGHTS OF HAVEMEYER LATH

2.2 lb. per sq. yd.	*3.00 lb. per sq. yd.
*2.5 lb. per sq. yd.	*3.40 lb. per sq. yd.

*Asterisk indicates weights that are standard.
All sheets are 24x96 in.; 1 7/8 sq. yd. per sheet; 9 sheets per bundle; 16 sq. yd. per bundle.

Flat-Rib Metal Lath

Has reinforcing ribs 1/2 in. wide, 1 3/4 in. apart center to center. A rigid, flat, strong lath, permitting wide spacing of studs, joists or channels, saving both labor and material.

Sheets are square and there is no loss in laps. They permit scratching in of the mortar and doubling back from same scaffold, practically two-coat work; a decided economy in both mortar and labor.

Weights per yard: painted, 2.75, 3.2 and 3.5 lb.; galvanized, 3.6 lb. Sheets are 24x96 in., 9 sheets to the bundle, covering 16 sq. yds.

Fig. 17. Flat-Rib Metal Lath

Havemeyer 3/4-in. Rib Lath

For roof construction, partitions, floor slabs, outside walls, etc.

Windows—Rolled Steel—All Types

Information furnished on request.

Havemeyer Expanded Metal

Sizes with large diamonds are used for reinforcing, especially for culverts, sewers, bridges, tanks, etc. Smaller diamonds for machinery guards, enclosures, railings, lockers, stucco, etc. Furnished in full range of sizes from 3x7 in. to 1/2x1 3/4 in.

Fig. 18. Havemeyer Expanded Metal

Havemeyer Channels, Angles, Flats

Hot Rolled—Furnished in any size on short notice.

Fig. 19. Havemeyer Cold Formed Channel

Cold Formed—For suspended ceilings, furring, columns, false beams, cornice work, or for solid or hollow partitions. Stock lengths, 12, 14, 16, 18 and 20 ft.

STANDARD SIZES HAVEMEYER CHANNELS

Gauge No.	16	16	16	16
Width	3/4	1	1 1/2	2
Flange	3/8	3/8	3/8	3/8
Weight per 1000 ft.	276	332	456	580

Havemeyer Corner Beads

Wing Bead—No. 26 gauge special analysis galvanized sheet. Stock lengths, 6, 7, 8, 9, 10 and 12 ft.; 10 pieces to bundle; weight, 200 lb. per 1000 ft.

Curved Point Base Screenshot—Forms a permanent ground for plastering and secures a sanitary base with precisely true lines. Fabricated from tightcoat galvanized open-hearth sheets. Lengths 10 and 12 ft. Weight 225 lb., crated, per 1000 ft.

Bull Nose Bead—No. 26 gauge galvanized steel, 3/4-in. radius. Lengths, 6, 7, 8, 9 and 10 ft.; weight, 273 lb. per 1000 ft.

Base Bead

For cement base No. 26 gauge galvanized sheets. 12 pieces per bundle; weight, 135 lb. per 1000 ft.

Expansion Corner Beads

Made of tightcoat, galvanized, open-hearth steel. Takes much less time to erect than other types.

Fig. 20. Expansion Corner Beads

Furnished in 6, 7, 8, 9, 10 and 12-ft. lengths. Weight per 1000 ft., 240 lb.

Also cut from pure copper or zinc for exterior use with stucco.

Expansion Bull Nose Bead

Weight: No. 26 gauge, 375 lb.; No. 24 gauge, 470 lb.

Expansion Trim

Information furnished on request.

Havemeyer 3/8-in. Rib Lath

An exceptionally stiff metal lath—A labor and material saver, therefore a money saver.

Sheets are 24x96 in.; ribs spaced 4.8 in. center to center; ribs 3/8 in. high. Rapid erection results from using a smooth sheet. Economy results from perfect fit of interlocking ribs along sides and ends, from reduced number of fastenings to supports, and from saving in material by spacing supports further apart without sacrificing stiffness of plaster.

Fig. 21. Havemeyer 3/8-in. Rib Lath

MAXIMUM SPANS RIB LATH

Products

"STEELCRETE" MESH for the following uses: Expanded Metal Concrete Reinforcement; Road Mesh for Highway Reinforcement; Bank Vault Protection; Beam Wrapper.

Also Underwriters' Tested "Steelcrete" Mesh and Accessories for safety guards, shop enclosures, window guards, lockers, etc.

For Expanded Metal for Armored Vaults, see page A1103; for "Steelcrete" Expanded Metal Plastering Lath, Stucco Binder, Corner Bead and Cold Rolled Channels, see page B1293.

Sectional Area

Expanded metal sheets up to 16 ft. in length are furnished with a sectional area of .60 sq. in. and under. The 12-ft. sheets, and shorter, may be had up to 1.00 sq. in.

Scope of Use

"Steelcrete" mesh is the most widely used and oldest of concrete reinforcements for floor and roof slabs, sewers, conduits, tanks, roads, highway bridges, culverts, retaining walls, etc.

In bank vault construction, the design provides an entanglement of steel embedded throughout the concrete; proof against the cutting flame.

Description

"Steelcrete" mesh as it is made today is a steel diamond mesh fabric, in flat sheets, cold drawn from special low carbon open hearth steel. The cold drawing of this material by the "Steelcrete process" increases the elastic limit to above 55,000 lb. per sq. in., and thoroughly tests each strand. Thus "Steelcrete" has a guaranteed elastic limit more than 60% higher than commercial medium steel.

Slabs reinforced with "Steelcrete" mesh are better adapted to severe usage than slabs reinforced with a steel having low elastic limit and of a low yield point.

Specifications for the Use of "Steelcrete" Mesh Reinforcement

The "Steelcrete" mesh shall be laid on the forms with long way of the diamond meshes extending in a direction transversely to supporting beams. The separate sheets shall be lapped one mesh on the side and one or more meshes on the end, according to weight of metal used and other conditions, and wired together with annealed tie wire at a sufficient number of points for the purpose of holding sheets in position while depositing the concrete—unless the design is such as to allow the lapping of sheets on sides only. The concrete shall be deposited through the meshes of "Steelcrete," keeping the

metal about $\frac{1}{2}$ in. from bottom of slab. To obtain a more continuous action of adjacent floor slabs, and to prevent cracks over supports, the "Steelcrete" is raised to within about $\frac{3}{4}$ in. of top of the slab over supporting beams. (If "Steelcrete" occurs, in vertical walls, etc., the location and long way of meshes should be specified.)

STANDARDS FOR "STEELCRETE" EXPANDED METAL

Note: The above sizes are furnished in a diamond 8-in. length and approximately 3-in. width. Both sizes are furnished in stock lengths of 8, 10 and 12 ft. In addition, intermediate sectional areas will be furnished from stock lengths of 8 and 12 ft. The standard width of sheets will be furnished for each case on application.

Printed Matter and Co-operation

THE CONSOLIDATED EXPANDED METAL COMPANIES issue the following literature:

The "Steelcrete" Handbook, 240 pages, containing useful tables and designing data.

"Expanded Metal vs. Bars," giving tests.

"Time-tested Products," a booklet catalogue listing and describing all expanded metal products.

"Steelcrete Metal Lath," a booklet describing metal lath and kindred products.

"Steelcrete Industrial Mesh Handbook," a descriptive and instruction booklet on layout and fabrication of safety guards for all purposes.

Representatives and estimators travel out of all the various offices. "Steelcrete" products can be obtained from warehouses or mill shipments.

Standardized Metal Caging (Pat. Dec. 15, 1914)

"SMC," for fireproofing steel structures. A wire basket or cage (see illustration) which firmly grips beam flange extending below and beyond flange, permanently locking concrete protection to steel, thereby providing a continuous strengthening skeleton at a pre-determined or fixed offset distance from the flange.

Application of Standardized Metal Caging

End wire of section is caught over end of beam, and workman easily holds and pulls out section, which automatically locks to the structural member. Stretch out after applying

"SMC" cannot "bunch"; it pulls out like a camera bellows, maintaining equal spacing of about 5 in. under middle of beam. It clasps flange tightly at edges leaving a clear space for flow of concrete under flange. When used on girders, columns or deep beams, additional wires of special shape (see HS below) may be used to reinforce the side protection or haunches.

Exclusive features shown in illustration. "SMC" comes to job ready to use and can be easily applied by inexperienced labor.

"SMC" is shipped in collapsed sections about 4 ft. long, each containing 250 clamps, and is easy and inexpensive to handle. Such a section of size A, B, or C when pulled out, is sufficient to cover about 120 ft. of beam flange, 30 pieces of substitute material 4 ft. long or 120 pieces 1 ft. long would have to

be handled for the same length of beam, and then would only provide a more or less unsatisfactory substitute.

SIZES OF "SMC" FOR COLUMNS

	ATLANTA, GA.	ST. PAUL, MINN.	MINNEAPOLIS, MINN.	DETROIT, MICH.	

Products

CORRUGATED BARS for concrete reinforcement; COLUMN SPIRALS; STEEL TILE; CONCRETE ACCESSORIES: Spacers, Beam Chairs, etc.; Screed Chairs; Inserts; Sleeper Anchors.

Also Corr-Bar Units; Metal Lath; Wire Fabric; Steel Grating; Metal Column Forms; and related products.

Corrugated Bars

Deformed bars of highest grade steel, rolled from new billets exclusively, in square and round sections in accordance with the following schedule.

STANDARD SIZES CORRUGATED BARS

1	.78	2.69			

Information as to standard price extras for size, length, quantity, etc., furnished on request.

Corrugated Rounds (Patented)

Corrugated Squares (Patented)

Column Spirals

Kalman spirals are strongly and accurately made; coiled by machinery of special design, which preserves regularity of diameter, and assembled to specified pitch, length, and diameter with stiff channel iron spacers to maintain alignment and allow collapsing for convenient shipment and handling.

Column Spiral

Corrugated Bars

TRADE-MARK

Removable Steel Tile

Contractors report that Kalman removable steel tile effect savings in form work that often mount to as high as 3¢ per sq. ft. of floor area on ribbed construction.

Because of the large investment involved, Kalman removable steel tile are leased to the contractor and erected by the Corr Service Erection Co. Every piece of Kalman removable steel tile is completely cleaned and reconditioned before it is put on a job.

Concrete Accessories

Bar Supports and Spacers—Practical devices to aid in accurate and economical setting of reinforcing steel.

Clip Spacers—The new Kalman clip spacer is the nearest to an automatic bar holding device that can be made.

With it, accurate steel setting is reduced to the simple job of stepping on the bars after they have been laid in position.

The New Kalman Clip Spacer

The legs of this spacer are spaced exactly as specified. On each leg is a strong wire spring clamp. The steel setters drop a bar over each leg of the spacer—stepping on each bar as they go. As a result, every reinforcing bar is automatically forced into the spring clamp.

And once in place, the bars are *locked*—they cannot move in any direction. Such things mean new setting speed; new spacing accuracy, new low costs. Write for bulletin.

Rib Chairs—Unusually economical accessories that assure the absolutely accurate steel setting required in ribbed slab construction of any kind. Kalman rib chairs are made to fit the ribs for which they are intended. Because of this, they can be quickly placed in position. All the steel setter has to do is to drop the bars into these chairs. They hold the bars in the exact position specified. And they do not interfere with the flow of concrete.

Furnished in sizes for 4 or 5-in. rib width, in $\frac{1}{2}$, $\frac{3}{4}$ or 1-in. rod elevation.

Rib Chair

Beam Chairs—Kalman beam chairs are made of heavy wire, are electrically welded, and trussed for added lateral stiffness. They are rigid and strong, and hold

Kalman Beam Chair

reinforcing bars exactly as specifications say they should be.

Made to order to fit any reinforcing requirement and any beam design. Furnished in any height up to and including 2½ in. Packed in strong fiber cartons.

Beam Bolster—An unusually strong and adaptable support for beam reinforcing. They can be set quickly and easily. Furnished in stock lengths of 4 or 5 ft.; to be cut to shorter lengths on the job when required.

Beam Bolster

Kalman beam bolsters can be had in various heights from 1 to 4 in. Shipped in bundles of 100 ft. Always carried in stock for immediate shipment.

High Chairs—The new Kalman high chair can be used wherever tees or steel bars are needed to support concrete reinforcing.

The legs pull apart and lock at the exact height specified. Then, the supporting bars are dropped into

Used with Steel Bars Used with Tees
Kalman High Chair

the cradle of each chair. Or, if tees are used, the chair is simply turned around, and the stem of the tee is inserted in a slot at the top, where the legs meet.

Kalman high chairs are made of hard steel wire and will not sag or spread. They hold either tees or reinforcing bars in place at any height from 3 to 15 in.

Screed Chairs—Used for accurately striking-off concrete floor slab. The main body is made of a single piece of heavy steel wire. Attached to each leg of this is a movable supporting wing.

On the job, Kalman screed chairs are easily set. The wings can be moved to any position desired—and a nail in the end of each makes the entire chair absolutely rigid. Leveling pipes are laid in the grooves of each chair—concrete is poured and the entire job is finished by pulling the screed boards across the leveling pipes. After screeding, the pipe is removed for re-use. The chairs stay in.

The New Kalman
Screed Chair

Inserts

The Kalman hanger insert safely supports loads up to 300 lb. from concrete slab ceilings. Push it down at the desired spot on the forms, hit it a few blows with a hammer, and the setting job is finished. No further work is necessary. A wire ring or a strap hanger drops below the ceiling level when the forms are taken down. Supports are easily fastened to this.

Hanger and Adjustable
Inserts

For heavier loads, the Kalman adjustable insert assures absolutely safe hanging. It is made of malleable iron and will last as long as the concrete itself. With it, there are no nails to clip. The holding staple stays in the forms.

Sleeper Anchors

Devices for securely fastening nailing strips to the top surface of concrete slabs. Sleeper anchors are embedded in concrete while it is soft and, after the concrete is set, they provide a strong, positive, and permanent anchorage for sleepers. Kalman sleeper anchors are the most efficient devices so far developed for this purpose. Their V-shaped loops readily penetrate to full embedment in the concrete and provide a perfect mechanical bond, which absolutely prevents loosening once the concrete is set. Made of No. 20 gauge metal and heavily galvanized to resist rust. Furnished in three sizes for 2x2, 2x3, and 2x4-in. sleepers. All sizes carried in stock for immediate shipment.

Sleeper Anchors

Column Forms

Adjustable metal forms strongly and simply made. They produce true round columns with accurate and graceful profiles where the flared head merges with the shaft. Kalman column forms are furnished to contractors on a lease and erection basis.

Column Form

Engineering Service

Expert engineering service is one of the most valuable features of the KALMAN STEEL COMPANY Service. At all district sales offices expert help is available on matters of estimate, design, and detail of reinforced concrete structures of all types, together with reliable advice concerning the use and purposes of all Kalman products.

Products

CONCRETE REINFORCING MATERIALS, including: Plain and Deformed Reinforcing Bars, Triangle Wire Mesh, Electrically Welded Rectangular Mesh, Column Spirals, Continuous Wire Mesh Stirrups, Beam Wrapping, Fabricated Units, Road Center Strips, Wire Rods, Wire, Furring Channels and Angles, Miscellaneous Reinforcing Accessories, such as Bar Chairs, Bar Spacers, Bar Ties, Inserts, etc.

EXPANDED METAL PRODUCTS, including: Expanded Metal Lath, Expanded Metal Reinforcing, Corner Beads, Metal Picture Mouldings, Base Screed, Base Grounds, Rib Lath.

SAFETY TREADS AND PLATES, including: Mason Safety Treads, Firmtread Floor Plates and Treads, Sheet Steel Subtreads and Risers.

IRON AND STEEL PRODUCTS, including: Bars, Bar Shapes, Structural, Rails, Plates, Sheets, Boiler Tubes and Fittings, Shafting, Chain, Rivets, Bolts, Nails, Refined Iron, Alloy Steel, Tool Steel, etc.

SMALL TOOLS.

Bars

At our eight warehouse plants located throughout the country, we carry a complete stock of plain and deformed bars, both round and square. These bars are rolled from new billet stock, conforming to standard specifications of the American Society for Testing Materials, Serial Designation A-15-14. Bars, of structural, intermediate and hard grade, are carried in stock in lengths up to 60 ft.

Round deformed bars are carried in the following diameters: $\frac{3}{8}$, $\frac{1}{2}$, $\frac{5}{8}$, $\frac{3}{4}$, $\frac{7}{8}$ and 1 in. Square deformed bars are carried in the following sizes: $\frac{1}{2}$, 1, $1\frac{1}{8}$ and $1\frac{1}{4}$ in.

Ryerson Round Deformed Reinforcing Bar

Ryerson Square Deformed Reinforcing Bar

A Few Ryerson Reinforcing Products

Bending and Fabricating

We have the most up-to-date machinery and other equipment for fabricating, and can bend bars to any shape required for beam, joist and slab rods, stirrups, ties, hoops, etc.

Spirals and Continuous Hooping

On our spiral machines we manufacture spirals for round columns, continuous uniform hooping for square and rectangular columns, and continuous single unit stirrups for beams and girders. Spirals are made from new first quality wire rod in sizes from $\frac{3}{16}$ to $\frac{1}{8}$ in., inclusive.

Both round and square hooping can be collapsed for shipment.

Triangle Wire Mesh Reinforcement

We always carry on hand a large stock of triangle wire mesh for slab reinforcement. This material is carried in rolls in standard gauges and sizes of mesh and can be shipped at once. Electrically welded rectangular mesh, is also in stock, or can be shipped direct from factory.

Road Strips and Highway Construction Material

We furnish completely fabricated material for reinforcing roads, culverts and bridges, including metal road strips and all necessary reinforcing fabrics, supports and spacers.

Accessories

In addition to bars and spirals, we carry complete stocks of all accessories such as beam, joist and slab bar spacers, bar and screed chairs, bar ties, wire, etc., also wire fabric and expanded metal for reinforcing roadways and for floor slabs, concrete pipe, etc., angles, channels

and pencil rods for suspended ceilings, furring and similar purposes.

Continuous Wire Mesh Stirrups

Continuous wire mesh stirrups are formed on our specially constructed power machines, thus insuring accurate bending and perfect alignment. Continuous stirrups save time and money in the job, eliminating slow and tedious hand tying of bars and individual stirrups. Over 30,000 of these continuous stirrups were used in the construction of the Palmer House in Chicago.

We are also equipped to furnish beam wrapping, step reinforcement and other special pieces formed from wire mesh.

Continuous Stirrups Made from Electrically Welded Fabric

Expanded Metal Reinforcing

We are prepared to furnish from stock, expanded metal in meshes varying from $\frac{1}{2} \times 1\frac{1}{4}$ in. to 3×8 in. and in a wide range of standard sizes. Special meshes and sizes delivered promptly, direct from the factory.

Metal Lath, Plastering Channels, etc.

$\frac{3}{4}$ -in. Rib Lath

Deep ribs and strong mesh eliminate the need of wood forms

We are in a position to furnish all the steel requirements for plastering. This service includes expanded metal lath, rib lath, scotch lath, corner bead, bullnose corner bead, picture mould, curved point base screed, base grounds, hot rolled channels, cold formed channels, pencil rods, angles, tees, flats, wire, etc.

Immediate deliveries from our warehouse stocks or direct from factories in Chicago and the East.

Welded Steel Windows

Standard industrial units can be furnished at once from stock, either with or without ventilators. These windows are made of rolled sections, electrically welded at all intersections, giving the frame great rigidity and strength.

Continuous top hung windows with mechanical operators and architectural projected windows can be furnished to meet almost any requirement. Send your plans

Round Column Spiral and Continuous Hooping for Square Column
Both can be collapsed for shipping

Shipping Bay in a Ryerson Plant
Reinforcing materials ready for loading

for prices and complete description of our complete service.

Small Tools

Prompt service on all the hundred and one small tools needed for construction work is another feature of our complete service to builders. Every tool is backed by the Ryerson Guarantee. If you haven't our tool catalogue and price list, write and we will mail them at once.

Portable electric saws, electric drills, trench braces, jacks, hoists, furnaces, reamers, rivet forges, riveting hammers, electric hammers, clamps, grinders, punches, shears, drift pins, etc., are a few of the items available.

Delivery

Our large stocks of bars and other material enable us to make exceptionally quick delivery on reinforcing material—all cut, bent, bundled and tagged ready for the forms. By use of special aluminum tags with stamped, raised letters and numerals, the identification marks showing the location in the building of each bundle can not be obliterated. These tags are not subject to rust. Specially designed 40-ft. trailers for

This Tag Identifies Each Piece

tractors, with steel adjustable skids, enable us to haul the longest material and unload with a minimum of effort and without distortion or damage to the material. All of our Steel-Service Plants have private switch tracks connecting with trunk line railroads, affording exceptional service on freight shipments.

Ryerson Steel-Service

In addition to reinforcing materials we carry all kinds of steel products at each of our plants, thus giving the contractor a convenient source upon which to draw for such other steel as he may require on a job.

Products

REINFORCING STEEL, KAHN TRUSSED BARS; RIB BARS; COLUMN HOOPING; STEEL FLORETTES; CONCRETE INSERTS.

Also Curb Bars; Contraction Joints; Steel Road Forms; Welded Steel Fabric.

For Steel Roof Decks, see page A171; for Steel Joists, see page A578; for Steel Windows and Doors, see pages A1082-1085; for Metal Lath, etc., see pages B1306-1307.

Truscon Service

Because of the inclusiveness of the line of permanent building products which it manufactures, Truscon has no special interest apart from the economy it will effect for the client, in any particular type of construction. If Truscon is allowed to co-operate with you in the solution of a problem in structural design you are assured in advance of the unbiased assistance and advice of specialists whose only desire is to find the right solution. The service of Truscon's large staff of experienced engineers is yours for the asking.

$2 \times 3\frac{1}{2}$	36	(24) 30 (48)

*Note: The special lengths enclosed in parentheses are ordinarily available only for items of 5 tons or more.

Rib Bars

Special rolled steel section with series of cross ribs to secure maximum grip. Carried in stock in warehouses in various cities, furnished straight or bent as ordered.

Square Rib Bar

Round Rib Bar

Truscon Collapsible Column Hooping

For reinforcing concrete columns. Shipped in the form of flat, circular coils of exact diameter and accurately spaced by

TRADE-MARK

means of special spacers. These coils spring automatically into complete hooped column on cutting the small fastening wires.

Rib bars are ordinarily used as vertical reinforcement in conjunction with column hooping.

Diameter of coils: 9 to 36 in. Pitch: $1\frac{1}{2}$ to 12 in.

Truscon Floretyle Construction

Truscon Floretyle construction consists of rows of specially formed steel Floretyles separated by reinforced concrete joists and covered with a thin layer of concrete.

Ribbed Floretyles—The ribbed Floretyles used in this construction are manufactured in powerful presses operated with multiple dies which insure accuracy and uniformity. Across the tops, deep stiffening ribs give the Floretyles exceptional rigidity. The rib adjacent to one end of each tile is omitted, leaving a long free apron end to lap over the rib of the adjacent tile to readily obtain adjustment in the length of the row. The corrugated sides, rounded corners and corrugated flanges along the bottom edge add to the stiffness and prevent deformation.

Ribbed Steel Floretyles

Truscon Locktype System—An improved Floretyle construction consisting of deep ribbed steel Floretyle whose flanges are locked into the prongs of the ribs of Truscon Locktype Lath.

Truscon Locktype Lath is furnished in rolls 100 ft. long x 2 ft. wide, the ribs running in the direction of the 2 ft. width. It consists of ribs $\frac{3}{8}$ in. high spaced 4.8 in. center to center with a diamond mesh between the ribs. At the proper distance from the ends, each rib has a prong punched upward. Locktype Lath is shipped in rolls with the ribs turned inward. After it rolls out on the form, the ribs and prongs are on the upper side for immediate placing of the ribbed Floretyle.

Locktype construction is easily and speedily erected. It saves in concrete and plastering cost and insures true and straight concrete joists with positive attachment of the ceiling in reinforced concrete construction. It insures constant width of concrete joists, making unnecessary the use of any spacers, and saves all expensive nailing of the steel Floretyle to the form boards.

Placing Floretyles in Locktype Construction

Inset shows close-up of lath prong

Truscon Florestyle Construction with Cantilever End Tyles—Greater economy in reinforced concrete design is obtained by increasing the negative bending moments and decreasing the positive bending moments. *Stress—Strain* studies of completed structures indicate that the work of carrying loads is very largely done by these negative moments in monolithic construction like reinforced concrete.

Truscon Cantilever Florestyles, used at the ends of the rows, provide the width of concrete joists adjacent to the supports

Cantilever Florestyle Construction

necessary to take advantage of this more economical method of designing. Shearing stresses are also more economically handled by the increased width of concrete than by the use of loose stirrups.

Cantilever Florestyle can be used either with $\frac{3}{8}$ -in. Hy-Rib ceiling or with Lockstyle Lath. Cantilever end caps of proper size are used to close the small ends of the cantilever Florestyle.

Truscon Florestyle Construction with Removable Florestyles—In buildings comprised of several typical floors laid out in oblong panels, with long spans and not requiring a plastered ceiling, Truscon Florestyle construction with removable

Florestyles will often be found very economical. Truscon engineers, with years of experience from which to draw, are in an ideal position to show when this type of construction can be applied with the utmost efficiency. The removable steel Florestyles used in this construction are usually leased to the contractor for the duration of the job.

These removable steel Florestyles are made of 16 gauge steel, so designed as to be readily removable, extremely sturdy and very economical. The ribs across the top add to their rigidity, eliminating the necessity of excessive crowning, which is wasteful of concrete.

Truscon Removable Florestyles are furnished either with straight sides as shown or with a $\frac{3}{8}$ -in. flange along the bottom edge.

Properties of Removable Florestyles—Heights: 6, 7, 8, 9, 10, 11, 12, 13 and 14 in. Approximate width at base: 20 in. Standard lengths (nominal): 3 ft. Actual length is 1 in. greater, to allow for end laps.

End Tyles to close rows of Florestyles are furnished 14 in. high and 1 ft. 10 in. long. For other heights of removable Florestyle, use wooden ends nailed into the florestyle in the field or sheet steel end caps (non-removable) of the proper size.

Truscon Wydespan Construction

Truscon Wydespan Construction requires less concrete and less wasteful timber centering than other types of reinforced concrete systems. With Wydespan forms the joist spacing is

approximately 4 or 5 ft. and a top slab of only $2\frac{1}{2}$ in. is recommended. Comparative estimates indicate that Wydespan forms show a tremendous saving over other types of forms. An alternate design in Wydespan is the best argument for its use.

Properties of Truscon Wydespan Forms—Manufactured from 16 gauge steel.

Height: 16 in. only—but adaptable for 5 to 15-in. depths of floors.* Approximate width at base: 40 and 52 in. Standard length (nominal): 12 in. Actual length 2 in. longer to allow for end laps.

Truscon Slotted Inserts

Used in concrete slabs, beams or columns for attaching shaft hangers, fixtures, sprinkler systems, etc. Obviate expensive drilling into concrete in finished building. Built into concrete during process of construction by merely fastening them to wood centering. Standard lengths 12, 18,

24, 36, 48 and 60 in. For $\frac{1}{2}$, $\frac{5}{8}$, and $\frac{3}{4}$ -in. bolts.

Slotted Insert

Tapped Insert

Truscon Tapped Inserts

Made of highest quality pressed steel; furnished tapped for $\frac{1}{2}$, $\frac{5}{8}$ and $\frac{3}{4}$ -in. bolts or $\frac{3}{8}$ -in. pipe.

Used where exact location of attachment is known. This insert is especially designed for plumbers who require one which will accommodate pipe rather than standard bolts.

Adjustable Inserts

DIMENSIONS OF TRUSCON ADJUSTABLE INSERTS (INCHES)

Size	A	B	C	D	E	G
$\frac{1}{2}$	$2\frac{3}{8}$	$1\frac{3}{4}$	$\frac{7}{8}$	$1\frac{3}{8}$	$1\frac{5}{8}$	3
$\frac{5}{8}$	$2\frac{3}{8}$	$1\frac{3}{4}$	$1\frac{1}{8}$	$1\frac{3}{8}$	$1\frac{7}{8}$	4
$\frac{3}{4}$	$2\frac{3}{8}$	$1\frac{3}{4}$	$1\frac{1}{4}$	$1\frac{3}{8}$	$1\frac{1}{2}$	5

Adjustable Inserts

*Forms are provided with nailholes to permit raising or lowering them on the centering to secure any desired depth floor and joist within the above limits.

CLINTON ELECTRICALLY WELDED WIRE FABRIC for Concrete Reinforcement.

For Wire Lath, see pages B1274-1278.

Clinton Electrically Welded Wire Fabric

Scope of Use—Clinton welded wire, a mesh reinforcement, is especially suited for floors, roofs, walls, roads, sidewalks, sewers, reservoirs, levees and all kinds of slab construction.

The material is used to special advantage in all kinds of work involving the covering or protection of steel with concrete, as in buildings, bridges, subways and tunnels.

Material—Clinton electrically welded wire fabric is a wire mesh made up of a series of parallel longitudinal wires, spaced certain distances apart and held at intervals by means of transverse wires arranged at right angles to the longitudinal ones, and securely welded to them at the points of intersection by a patented electrical process.

Wire—Clinton electrically welded wire fabric is fabricated from a special grade of good quality steel wire, possessing such strength, elasticity, and ductility as to render it especially suited to structural use.

The wire will develop an average ultimate strength of 70,000 to 80,000 lbs., with a maximum, in some cases, of 85,000 lbs. per sq. in.

Innumerable tests and investigations which have been made upon welded wire during the past 15 years have proved, beyond the shadow of a doubt, that the process of welding does not in any way lessen the tensile strength of the longitudinal wires. Specimens when tested, whether they break at or between the welds, will invariably show the full tensile strength of the longitudinal wire when compared with the strength of the plain wire before welding.

Electric Weld—In Clinton welded wire the transverse wires are welded to the longitudinal wires by means of an electric current. They are not in any way secured by winding, or by loops or clips, and for this reason the casual observer sometimes concludes that the wires are merely soldered together. This idea is wrong. The connection is made

The Clinton Electric Weld

In this view the two wires have been cut through at their point of union, revealing a perfectly smooth surface. It is a perfect weld; the two wires are actually fused together.

by an absolute and perfect weld, in which the two wires are actually fused into one homogeneous section.

A great number of tests have been made upon the welded connections, and it has been shown that the shearing strength of the weld in many cases actually exceeds the tensile strength of the longitudinal wire.

Rectangular Mesh—Clinton welded wire is rectangular or square mesh. There are no zigzag or diagonal members in the material.

When used as reinforcement in floor slabs, the longitudinal members are thus located in the line of tension; while the transverse or secondary members, arranged at right angles to them, afford a most efficient means of distributing concentrated loads in a direction perpendicular to the main reinforcing members.

In floor slabs, designed and estimated on the basis of distributed loads, this is a most important factor in enabling a slab to receive a very heavy load on a small area. Clinton welded wire fabric, affording, as it does, an efficient transverse as well as longitudinal reinforcement, prevents cracking due to changes in temperature and provides a perfect network of steel which knits and binds the concrete together, reinforcing it securely in all directions.

Perfect Bond—There is perfect adhesion of concrete to this fabric, because it has no clips or wrapped wires to prevent free flow of the aggregate when it is being poured; therefore, no voids exist in the completed work. Transverse strands, which are of much heavier gauge than can be used in any other wire fabric, are securely welded to longitudinal strands at right angles to the latter, and provide absolute anchorage against movement of the fabric when subjected to strain.

Unbroken Continuity—By using Clinton welded wire in floor slabs it is possible to obtain a perfect continuity from span to span without any lapping or splicing of the members.

Fabric is delivered in rolls, and may be laid in continuous sheets up to 200 ft. in length. The result is no waste, no lapped ends, no weak points.

Roll of Clinton Electrically Welded Wire
Shipped also in sheets if desired

Economy and Accuracy of Installation—The use of welded wire eliminates all cost and trouble involved in the spacing and wiring of loose members. Spacing is established by machinery, and it is impossible for the relative position of various members to become changed in the slightest degree.

The fact that great quantities of material can be laid accurately in a very short time by unskilled labor, with absolute assurances that every strand of wire is in its proper position, renders welded wire the safest, simplest and most economical reinforcing material for all kinds of slab construction.

Finish—Unless otherwise ordered, Clinton electrically welded fabrics are furnished made with plain steel longitudinal and transverse strands. The price is lower than for fabrics galvanized throughout, the difference being controlled by the market price of spelter used in the galvanizing process.

Galvanizing—Clinton electrically welded fabrics are also made from steel wire, which is thoroughly galvanized before being welded. Galvanizing affords protection against the development of rust if the material is exposed to the weather by reason of delays in its use in the work, or if the concrete is of inferior quality and contains elements injurious to steel, or is so porous as to permit the entrance of moisture or destructive gases.

Reinforced Concrete Slab Tables

The tables following the illustrations of the arches are based on accepted formulæ. The loads given at heads of the varying tables cover customary roof and floor loads, and are the safe applied load in addition

to the weight of the slab. No allowance, therefore, need be made for the weight of the slab. The tables have been compiled on a basis of a maximum compression in concrete of 650 lbs. per sq. in. with a maximum tension in the steel of 20,000 lbs. per sq. in.; spans being

considered as continuous, i. e., $M = \frac{Wl^2}{12}$

REINFORCED CONCRETE SLAB TABLES

REINFORCED CONCRETE SLAB TABLES (Continued)
Table IX. Applied Load 250 Lbs. per Sq. Ft.

Thickness of slab, in.	Concrete below steel, in.	Clinton fabric required												
		Span of slab, in ft.												
		4	5	6	7	8	9	10	11	12	13	14		
3½	¾	4x16 5&10	3x16 4&9
4	¾	4x16 6&10	3x16 5&10	3x16 3&8
4½	¾	4x16 7&11	3x16 5&10	2x16 4&9
5	1	3x16 6&10	3x16 4&9	2x16 4&9	2x16 1&7
6	1	3x16 5&10	3x16 4&9	2x16 4&9	2x16 2&8
7	1	3x16 4&9	2x16 5&10	2x16 3&8	2x16 2&8
8	1½	3x16 3&8	2x16 4&9	2x16 3&8	2x16 2&8	2x16 1&7

Note: Values in all these tables indicate size of mesh and gauge of wires in Clinton fabric. Thus, 4x16, 7&11 indicates a fabric having No. 7 gauge longitudinal wires on 4-in. centers welded to No. 11 gauge transverse wires on 16-in. centers.

Reinforcements below and to left of zigzag lines may also be safely used in cinder concrete without exceeding 300 lbs. per sq. in. compression in the concrete. In using cinder concrete, applied loads as given may be increased 3½ lbs. for each inch thickness of slab.

Wire

Size of Wire—The fabrics listed below are suggested as combinations which may be used to special advantage. While all of these fabrics are not actually carried in stock, the majority of them may usually be obtained upon short notice. When only a small quantity is desired it is sometimes less expensive to use a stock grade, even though it possesses greater strength than the work requires.

The longitudinal or transverse strands may be of Nos. 0 to 13 inclusive, Washburn & Moen gauge wire. When the same size of wire is not required in both members of the fabric, the heavier size can be placed longitudinally or transversely, as may be specified, but there should not be a difference exceeding 6 numbers on heavy grades, or 5 numbers in light grades, between the longitudinal and transverse strands.

PROPERTIES OF WIRE AND SECTIONAL AREA OF FABRICS

Size per W. & M. gauge	Diam. of 1 wire, in.	Sectional area of 1 wire, sq. in.	Weight per lin. ft. of 1 wire, lbs.	Sectional area (sq. in.) of longitudinal wires only in 1 ft. of fabric width when spaced as shown below

Spacing of Longitudinal Wires—The longitudinal wires may be spaced on centers of 2 in., or more in steps of 1 in. The distance between centers of outside longitudinal wires can not exceed 100 in.

Spacing of Transverse Wires—The transverse wires can be spaced on centers of 2 to 10 in., inclusive, in steps of 1 in., and on centers of 10 to 18 in., inclusive, in steps of 2 in. They must project at least ½ in. beyond the outside longitudinals and may, if required, be extended to a maximum length of 102 in.

Rolls and Sheets—Special lengths of rolls or sheets, as may be required, can be made to order. Rolls may be of any desired length not exceeding 400 ft. in the light grades, depending upon the weight and convenience in handling. Sheets should not exceed 20x7½ ft. if shipped in box cars, or 32x8 ft. if shipped on flat cars.

Special Designs in New York, N. Y.

In the city of New York the allowable capacities of floor slabs are no longer based on tested approvals, but may now be determined by a newly devised method of computation which applies to flat slabs of either stone or cinder concrete when cast between steel beams, and only when the span of slab does not exceed 8 ft. For these conditions a minimum thickness of 4 in. is required.

While 4 in. is thus fixed as the minimum thickness of slab, still, a 4-in. thickness may be used on any span up to 8 ft., and for any load which does

not exceed the computed capacity of the slab; the actual capacity in any case being determined by the thickness of slab, the conditions of continuity, and the amount and kind of reinforcement used.

Because of the unaccountable strength of short span slabs as shown by actual tests, the city of New York has adopted an empirical formula to be used in designing slabs of 8-ft. span and less when confined between steel beams.

The tables below have been computed by this formula for the conditions of continuous wire mesh reinforcement.

SLAB REINFORCEMENT UNDER NEW YORK, N. Y., CODE

Sectional area of steel reinforcement required, square inches per foot in width, for concrete arches of various spans based on Clinton Electrically Welded Fabric

Total load in lb. per sq. ft. including weight of slab	Spans, in feet and inches

CHICAGO EXPANSION BOLT COMPANY

(Not Incorporated)

127 South Clinton Street
CHICAGO, ILL.

A Distributor Is Near You—Let Us Put You in Touch with Him

Products

DRIVE-IT EXPANSION NAILS; EXPANSION BOLTS; EXPANSION NUTS; EXPANSION PIPE AND CONDUIT HANGERS; EXPANSION ANCHORING UNITS; TOGGLE BOLTS.

Also Conduit or Pipe Clamps, Hand and Electric Reciprocating Drills and Tools for installing expansion bolts, Concrete Inserts and Expansion Shields.

Drive-It Expansion Nails (Patented)

A new expansion nail developed for holding wooden carpet strips in position over concrete floors.

A hole is drilled through the wooden carpet strip and into the concrete base in one operation in 30 seconds, by an electric hammer drill. The assembled unit, consisting of a lead alloy sleeve and hardened nail, is inserted and the nail driven, expanding the sleeve into every crevice of the hole, securing the wooden strip permanently. No vibration can

57 miles of carpet strip secured to concrete floors with Drive-It nails in this building

Chicago Expansion Bolt

Consists of 4 parts: galvanized bolt, soft lead cylinder, hard metal cone and nut. This bolt has been in service for 10 years and is standard equipment with many public service corporations and other large users. The 1/4-in. sizes will sustain direct full loads of from 1500 to 2000 lb. Double equipment will hold up to the strength of the bolt used.

1	1/2	1/2
1 1/4	1 1/2	1 1/2
1 1/2	1 3/8	1 3/8

Chicago Expansion Nut or Insert

Consists of only two parts which are assembled and used as one: an expansion member or sleeve of lead alloy compressed around a double wedge internally threaded member. The hump gives a greater expansion with a given amount of lead and provides maximum holding power in holes of various sizes.

The illustration shows the complete assembly in phantom view. Note that the threaded end of nut is near front of hole, giving space at bottom of hole to accommodate bolts of varying lengths.

Chicago Toggle Bolt

The standard fastening for use on tile walls. Inserted through hole in hollow tile walls, toggle drops at right angle, giving perfect anchorage.

KOHLER DIE & SPECIALTY CO.

Concrete Inserts and Metal Specialties

DEKALB, ILL.

CHICAGO REPRESENTATIVE: W. L. HARRISON, 1148 Builders Building

Products

ADJUSTABLE or SLOTTED CONCRETE INSERTS, Stem Type and Loop Type; THREADED CONCRETE INSERTS, Pressed Steel and Cast: FLATTENED END BOLTS.

Adjustable or Slotted Inserts

Stem Type—Made with a corrugated stem that extends up into the compression area of the concrete, the correct place to hang the load. The tapering, ribbed base is so shaped that it gives the greatest possible supporting strength to concrete member. In this insert, the fullest strength of the concrete is developed. The greater the load on the Collings insert the tighter the concrete grips and holds.

Note Corrugated Stem and Tapering Base with Flange at Top

View of Chamber for Bolt

Collings Insert

(Patented March 26, 1918)

The Collings insert, when placed in the form, is never in the way of the reinforcing bars, and is so designed that the concrete flows freely around it. There are no sharp corners and with the Collings insert less surface is exposed in the ceiling after the forms are removed than with any other—a very desirable feature.

The Collings insert may be used upside down in the floor for anchoring chairs, machinery or permanent fixtures, but its greater field is in the ceiling for supporting shaft hangers, sprinkler systems, electric lights, piping and overhead rails.

The size of the chamber permits the use of either the nut or the head of the bolt.

Loop Type—For use in thin slab construction. We are now prepared to furnish the adjustable inserts in loop type as illustrated. This is one of the best designed and most practical inserts on the market. Dimensions are as shown herewith:

Loop Type

ADJUSTABLE INSERTS—SIZES, WEIGHTS AND LIST PRICES

	Size bolt	Height	Weight per 100	List price
Stem type	$\frac{1}{2}$ in.	$3\frac{3}{4}$ in.	76 lbs.	16c each
	$\frac{3}{8}$ in.	$3\frac{3}{4}$ in.	90 lbs.	19c each
	$\frac{3}{4}$ in.	4 in.	115 lbs.	23c each
Loop type	$\frac{1}{2}$ in.	$2\frac{1}{8}$ in.	45 lbs.	13c each
	$\frac{3}{8}$ in.	$2\frac{1}{8}$ in.	63 lbs.	16c each
	$\frac{3}{4}$ in.	$3\frac{1}{8}$ in.	81 lbs.	20c each

Discounts will be quoted on application.

Flattened End Bolts

For use in suspending overhead piping and other work supported from concrete inserts. Flattened, punched, and threaded one end.

SIZES AND PRICES, FLATTENED END BOLTS

No. 3—Machine thread, bolt ends, $\frac{3}{8}$ x 2 in.	8c each
No. 4—Machine thread, bolt ends, $\frac{1}{2}$ x $2\frac{1}{2}$ in.	10c each
No. 5—Machine thread, bolt ends, $\frac{5}{8}$ x $2\frac{1}{2}$ in.	12c each

List prices are subject to discount, which will be quoted on application.

Kohler Threaded Concrete Inserts

Advantages—The Kohler Threaded Concrete Inserts are now supplied either with the screw point or with nailing lugs at the base for use in place of the screw points, as illustrated.

Pressed Steel Insert
Construction of $\frac{3}{8}$ and $\frac{1}{2}$ -in. sizes

Steel Insert in Form, with Screw Point in Place
Construction of $\frac{5}{8}$ -in. size

Insert without Screw
Construction of $\frac{5}{8}$ -in. size

This screw point makes it possible to set the insert accurately and quickly in the form. A blow with a hammer and a couple of turns with the hand sets this screw down so that the insert is held secure in a vertical position ready for the concrete to be poured. After the work is finished the forms are easily pulled away from the screws, which are then quickly removed, leaving the insert free for the threaded bolt.

Cast Insert with Screw Point

Exact Size of Screw Point Used in $\frac{5}{8}$ -in. Insert
(Patented Feb. 27, 1912)

Cast Insert with Nailing Lugs

The cast threaded inserts with the nailing lugs at the base are preferred in many places instead of the screw points. They are quickly set and the cost is less.

THREADED INSERTS—SIZES, WEIGHTS, AND LIST PRICE

Economy—These inserts, regularly spaced in the ceilings, floors or walls of reinforced concrete buildings mean a saving of time and heavy expense in attaching or rearranging shafting, piping or other interior equipment. A necessity in concrete construction.

SECURITY INSERT COMPANY

Ceiling Sockets for Concrete Work

145 West Oxford Street
PHILADELPHIA, PA.

Product

THE SECURITY INSERT, or CEILING SOCKET, for Concrete Work.

The Security Insert

The Security Insert solves in a practical way the problem of the hanging of machinery or fixtures from the ceilings or walls of factories, warehouses and other buildings of concrete construction.

Its design is the result of most careful and exhaustive study. The practicability of the Security Insert is proven because it is being specified repeatedly.

The illustrations show the ease of installation and many other commendable features of this socket, such as the absence of any fixed thread, the ease and flexibility of placement of bolt and nut, the strength of design, maximum grip in the concrete, etc.

Introducing or Removing Nut

Bolt and Nut in Position

Eleven Reasons for Specifying the Security Insert

The design, construction, and application of the Security Insert embody many superior features of which the following are the most important:

(1) The sturdy design of the Security Insert enables it to carry, with a factor of safety, the safe load of the bolt.

(2) The nut being placed up in the concrete, the strain is not entirely dependent on the casting, but is reinforced by the concrete itself.

(3) It has no fixed thread to become rusty or damaged.

(4) In place of fixed thread a standard steel nut (the strongest thread possible) is placed in the insert when ready to use.

(5) This nut is renewable at any time.

(6) A stud or a bolt may be used, whichever is more convenient for the work.

(7) The Security Insert may be nailed to the form, thus avoiding waste of time and lumber, and the large flat base assures its remaining upright during pouring.

(8) A unique and convenient way to install the Security Insert is the use of a machine cut wood block as shown in the illustration. This block fits into the rectangular shank of the insert which is merely set down over it. With this method there are no nails left protruding from the ceiling to be clipped off. The resultant savings reduce the cost per insert set in place.

(9) It is desirable to place inserts in all parts of concrete buildings, even offices, storerooms, etc., for they provide easy means for fastening partitions, etc. A unique and exclusive feature of the Security Insert is that the holes may be concealed by means of a cardboard disk which fits the washer recess and can be painted.

(10) Once placed, the Security Insert is always ready for use. There is nothing in the socket to get out of order or deteriorate.

(11) The Security Insert has been found to be the most practical means for providing safe, permanent anchorage for any loads from the lightest partition to the heaviest crane.

Safety

Above all, the Security Insert is safe. Even with vibrating loads the nut and bolt are secure. Besides, the Security Insert will carry with a factor of safety the safe load of the bolt.

Indorsed by Builders Everywhere

Many of the finest industrial buildings in the United States are equipped with Security Inserts.

A list of prominent installations will be sent on request.

STERLING FOUNDRY CO.

Manufacturers of Concrete Inserts and Building Specialties

88 Estews Street
STERLING, ILL.

Products

The "BEST" CONCRETE INSERT (patented Oct. 12, 1926)..

Also "Star" Coal Chute (patented), Foundation Gratings; Flue Thimbles; Back Pressure and Bell Trap Floor Drains; Cistern and Coalhole Covers and Rings; Patent Glass Door Fuel Chutes; Stud Sockets; Clean-out Doors; Foot Scrapers; Chimney Caps; Revolving Chimney Tops; Adjustable Ventilators.

"Best" Concrete Insert

It is very simple and compact in design; strong and rigid in construction and one of the quickest in action (placing or removing bolt) on the market. To place bolt in insert, bolt is held in vertical position with the threads down. In an instant with a slight hook motion, the head of the bolt is seated in a wrench-shaped socket. (See illustration below.)

Insert with Wall Broken
Showing Bolt Seated
in Socket

Insert with Wall Broken
Showing Bolt Ready to
Be Pushed Over Into
the Seat Socket

Design

The design of the "Best" Concrete Insert permits either the head of the bolt or the nut to be placed in the insert, the wrench-shaped socket being large enough to take the nut, but small enough to give a "viselike" grip to the head of the bolt. The form and depth of the seat socket holds the bolt securely while the nut is being turned on or off.

Plan View. Top Re-
moved—Looking
Down

With this insert there is no possibility of a nut becoming rusted in or the thread being "jimmied" so that the bolt cannot be taken out of the insert.

Ordinarily, it is better practice to put the head of the bolt in the insert and allow the nut to be on the outside where it can be seen and can be tightened if it works loose.

Strength

The insert is designed to take the full strength of the bolt and puts the metal in compression. They can be safely used with the usual factor of safety for bolts.

If desired, an eye bolt with standard head on the

Insert Showing Bolt in Position

other end can be used for raising a load by means of a differential block. This is a great convenience in a machine shop for raising materials to a machine and in a factory for changing die blocks.

If in a vertical wall, the bolt is supported in almost a horizontal position by the side of the insert. If desired, the insert can be held in place by wiring it to a reinforcing rod, as shown in cut below. Notches have been provided in the top of the insert, so this can be done quickly and securely.

UNION STEEL PRODUCTS COMPANY

Continuous Chair Stirrups, Reed Soffit Clips,
Continuous Sleeper Spacing Anchors

ALBION, MICH.

BRANCH OFFICE: CHICAGO, ILL., 1148 Builders Building—Telephone, Randolph 6635
EASTERN FACTORY, ALBERT OLIVER & SONS, 711 East 140th Street, NEW YORK, N. Y.

Products

CONTINUOUS CHAIR STIRRUPS.
REED SOFFIT CLIPS.
CONTINUOUS SLEEPER SPACING ANCHORS.

Continuous Chair Stirrups

Concrete beam and joist reinforcement. Pre-spaced, shop assembled, welded stirrup units.

These stirrup units are made from the framing plans and reinforcing steel schedules, in any length, width, depth, or spacing. They are made of new billet steel only. The individual stirrups are *exactly* spaced in accordance with the specifications and held rigidly together by three longitudinal wires welded in place. Chairs and side spacers are welded on the bottom of the end and center stirrups in each unit.

Setting 13 Joist Stirrups in Form in One Operation

Steel setters place these stirrups in the forms in one-tenth the time required to set individual stirrups. The correct number of stirrups and exact spacing absolutely assured. No shifting when concrete is poured. No chairs required. Elimination of practically all hand wiring of stirrup wires to reinforcing rods. Shear reinforcing in finished beams must be in exact accordance with plans. Speeding up of the job an important factor.

Continuous Chair Stirrup Specifications—Beam and joist stirrups to be pre-spaced and welded together in a complete unit, with chairs and stirrup spacer incorporated in stirrups, of size, type and spacings as called for on plans, and as made by UNION STEEL PRODUCTS COMPANY, Albion, Mich., or similar construction.

PATENT APPLIED FOR

Continuous Sleeper Spacing Anchors

Reed Soffit Clips

Good practice demands that fireproofing around steel beams, girders, channels and columns be reinforced with some form of uniformly spaced clip. Reed Clips accomplish this purpose economically and efficiently.

Reed Soffit Clips are offset 1 in. from the flange, clips are spaced 12 in. apart; clips and longitudinal members are made of No. 12 galvanized wire. Manufactured and stocked in 5-ft. lengths; all widths from 3 to 30 in., varying by inches. Projections beyond loop vary from 2½ to 6 in. depending on width.

Specifications—Wrapping for reinforcing concrete fireproofing, of all-steel column flanges, and soffits of all-steel beams, girders, and channels to be of welded wire type, constructed so reinforcing wires are offset 1 in. from face of flange and firmly

Uniformly Reinforced Beam Soffits

clamped to steel members, such as the Reed Clips made by UNION STEEL PRODUCTS COMPANY, Albion, Mich., and ALBERT OLIVER & SONS, 711 East 140th Street, Bronx, N. Y., or similar construction.

Continuous Sleeper Spacing Anchors

Continuous sleeper spacing anchors will assure correct and automatic spacing of sleeper anchors. No templates nor measuring necessary. Anchors are embedded in the concrete. The long wire rod is flush with the surface. The sleeper is placed in the cradle between each pair of anchors. Then the loops that project above the surface of the concrete are raised against the sleepers with a clawhammer. With the same hammer nails are driven through the eyelets into the sleeper.

Specifications—Sleeper anchors to be of group type composed of several pre-spaced wire clips rigidly connected together, of size and spacing as called for on plans and as made by UNION STEEL PRODUCTS COMPANY, Albion, Mich., and ALBERT OLIVER & SONS, New York, N. Y.

RAIL TRUING INSERT COMPANY

Manufacturers of Rail-Tru Inserts

606 Marquette Building, DETROIT, MICH.

Products

RAIL-TRU INSERTS for anchoring pipe rails to concrete.

Rail-Tru Inserts

The problem is to anchor pipe railing in concrete securely and in a vertical position. Concrete forms ordinarily warp and, naturally, any insert attached to the form for location is thrown out of true. With the insert out of true it is impossible to make railing line up without shims. Furthermore, only an insert placed before the concrete is poured can be permanent.

A problem of this kind can be solved only

Rail-Tru Insert Assembly

rail truing, the turning of one or both of the adjustment rings causes the pipe railing to immediately assume a vertical position. The process is extraordinarily simple, and the adjustment may be made after the railing is in place.

With Rail-Tru Inserts it is not necessary to cut the forms—the inserts being self-centering. The center point is located very simply by driving a nail through the form. This nail fits into the centering hole in the face of the Rail-Tru Insert which can then be “back-nailed” to the form.

Rail-Tru Inserts do away with the need of shims which work out, expansion bolts which do

Various Methods for Using the Rail-Tru Insert

by use of Rail-Tru Inserts—the insert with the beveled adjustment rings. In the design of these inserts for

not always hold the flanges securely, and pipe sleeve calking is very uncertain at best.

Specifying Rail-Tru Inserts offers the architect the only method we know of that will ensure permanently secure, rigid anchorage for pipe railings. Furnished in four standard sizes to fit 1¼, 1½, 2 and 2½-in. standard pipe thread.

Specifications

Railing supports for all concrete stairs, ramps, platforms, area and retaining walls or wherever shown, shall be anchored with Rail-Tru Adjustable, Self-centering Inserts as manufactured by the RAIL TRUING INSERT COMPANY, Detroit, Mich.

All inserts shall have approved means of adjusting the true vertical position.

The use of split pipe, sleeves and other devices requiring expansion bolts, shims or calking for anchoring and plumbing rail supports shall not be permitted.

ACKERMAN-JOHNSON CO.

Expansive Screw Anchors, Expansion Bolts, Concrete Inserts

625 West Jackson Boulevard
CHICAGO, ILL.

Products

ACKERMAN-JOHNSON EXPANSIVE SCREW ANCHOR; EXPANSION BOLTS; CONCRETE INSERTS. U. S. Patents: April 27, 1915, December 21, 1915, April 4, 1916, May 14, 1918; others pending. Patented in Canada, Great Britain, France, Belgium; others pending.

Ackerman-Johnson Expansive Screw Anchor

Adaptability—For attaching objects to hard materials, as concrete, brick, stone, tile, marble, etc.

Description and Operation—Consists of a doubly tapered internally threaded cone made of brass, iron or steel (Fig. 1), within a lead composition ductile sleeve (Fig. 2). These are assembled at the factory, the sleeve being forced on the cone to a normal position as at Fig. 3.

Fig. 1

Fig. 2

Fig. 3

Ackerman-Johnson Expansive Screw Anchor

When installed as illustrated, the sleeve is driven farther toward base of the cone and is expanded generally to any degree required to swedge tightly against the sides of hole, effecting perfect holding contact throughout the length and circumference of the anchor. Thus consolidated with the wall material, the anchor provides a machine threaded hole the same as an ordinary tapped hole in a machine part. Any object may then be attached with a standard screw or bolt of suitable diameter.

Fig. 4. Manner of Installing Anchor

The piloted setting punch supplied without charge with all anchors

The heavier the load attached, the more forcible becomes the expansion, causing the anchor to resist effort to pull it out far beyond the tensile strength of any screw or bolt.

Distinctive Advantages—Time saving through the use of Ackerman-Johnson anchors compared with old methods more than compensates their total cost.

They save much of drilling cost, requiring least depth for any stated load. They are installed instantly, without the aid of the screw, and before the fixture is lifted into position to be fastened. Their margin of safety is equal to that of steel bolts of correlating size.

They necessitate the least displacement of wall material and consequently less injury to buildings. They effect the neatest possible workmanship.

Sizes—The size of anchor is designated as the size of the bolt or screw to be used. Example: For

No. 10-24 screw, use No. 10-24 anchor; for $\frac{3}{8}$ -in. bolts use $\frac{3}{8}$ -in. anchor.

SIZES, EXPANSIVE SCREW ANCHORS

Screw or bolt size, in.	Threads per in.	Minimum dimension of holes required, in.		Specify anchor Size No.

Users of Ackerman-Johnson Products

Extensively adopted by leading contractors, manufacturers, railroads, shipyards, government departments and public utility companies.

ANKYRA MANUFACTURING CO.

Manufacturers of Expansion Bolts

149 Berkley Street, Wayne Junction
PHILADELPHIA, PA.

Product

ANKYRA ANKOR (Expansion) BOLTS.

Purpose

To provide a means of holding fixtures to any wall, whether hollow or solid, and so holding them that they shall never come loose.

Uses

The uses for Ankyra Ankor Bolts are too many to permit of more than a description of typical cases.

Ankyra Ankor Bolts will fasten fixtures to lath and plaster, hollow tile, glazed tile, expanded metal lath, compoboard, sheet metal, brick or concrete walls—in fact they may be used in any sort of wall with assurance that the fixture will “stay put,” and yet that it may be removed and replaced at will, if alterations or renewals are necessary.

The illustrations show some uses; but a booklet giving detailed information will be mailed on request.

Other Advantages

Unlike wooden or lead plugs which are prone to loosen quickly because they dry out or are so soft that the threads wear out rapidly, Ankyra Ankor Bolts remain in the wall—rivet themselves in it—and, being made of steel, last indefinitely.

ANKYRA BOLTS USED FOR HOLDING FIXTURES IN BATHROOM

Tests show that Ankyra Ankor Bolts will support a greater load than can be carried on any hollow wall regularly used on standard construction.

- (1) The Ankyra sleeve is a self-riveting wing nut.
- (2) Ankyras can be installed so quickly that the labor and time saved is an exceedingly important factor. Contractors and plumbers have reported that they saved as much as 90% over ordinary methods.
- (3) Ankyras obviate the necessity of sounding for

TRADE-MARK
(Reg. U. S. Pat. Off.)

studding or making previous provision during construction for the location of fixtures.

- (4) The fixture may be removed by taking out screw, but Ankyra nut will not drop down inside of wall as it is an integral part of sleeve or bolt.

ANKYRA BOLT EXPANDED
Note wood screw
Self-riveting; self-adjusting

ANKYRA BOLT WITH
WOOD SCREW
BEFORE EXPANSION

- (5) Ordinary standard wood screws are used with Ankyra and may be selected to match other hardware.

- (6) Ankyras will hold until the wall itself gives way.

- (7) The alignment of grounds can be controlled regardless of irregularities in the face of the wall.

- (8) Ankyras are easily and quickly installed.

- (9) The solution to many especially vexing problems.

Fastening wall radiators to nearly any kind of wall, but more particularly to tile walls, is usually a ticklish proposition. Ankyras hold the radiator hooks firmly to any kind of wall and are easy to install, as well as permanent.

Bathroom fixtures—especially in public places—break loose with annoying and expensive frequency. The remedy lies in Ankyras which not only hold permanently, but can be used without fear of cracking or breaking the tile.

WALL RADIATOR
PLACED ON TILE
WALL

References

Hundreds of thousands Ankyra Ankor Bolts have been used in many of the largest and best known buildings in this country and Canada. Among them are:

The Woolworth, Metropolitan, Equitable and Widener Buildings; Massachusetts Institute of Technology; the Ritz-Carlton, Bellevue-Stratford and Marlborough-Blenheim Hotels; Detroit Free Library.

THE DAYTON SURE GRIP & SHORE COMPANY

Manufacturers of Sure Grip Sleeper and Furring Clips, Inserts, Form Tie and Spreader

East Monument Avenue

DAYTON, OHIO

REPRESENTATIVES IN ALL PRINCIPAL CITIES

Products

SURE GRIP SLEEPER and FURRING ANCHORS, INSERTS, CONCRETE FORM TIE and SPREADER, and ADJUSTABLE SHORES.

Sleeper and Furring Anchor

A grip made of one-piece No. 20 gauge galvanized Armco Ingot Iron, which securely anchors sleeper to concrete floor slab. Is also used for furring on ceilings, beams, piers, columns and sidewalls of either concrete or brick.

Corrugated legs furnish positive anchorage to concrete.

Grip is full $1\frac{5}{8}$ in., in width, which permits the tacking of abutting ends of sleeper in one grip, leaving no loose ends to warp and squeak.

Center spacing section of the grip can be picked out, without in any way interfering with the working of the grip or its holding strength with concrete, where necessary high spots of concrete slab demand leveling.

Made in 2, 3 or 4-in. sizes.

Samples and installation data furnished on request.

Sure Grip Concrete Insert

Made of the best grade of certified malleable.

Wedge construction, which places the concrete in compression plus the extended flange that takes direct shear, enables Sure Grip Insert to carry with a large factor of safety, the safe load of bolt.

Adjustable in all directions.

Made in $\frac{1}{2}$, $\frac{5}{8}$ or $\frac{3}{4}$ -in. sizes.

Sure Grip Form Tie and Spreader

A one-piece wall form tie and spreader, that completely eliminates the old slipshod method of nailing

forms, twisting wire in forms and the old *wood spreader* (more generally left in the concrete than taken out).

Guarantees a perfectly straight wall, of the size specified.

Made in all sizes from 6 to 60 in. to fit any condition.

Samples and Literature

Samples and literature furnished on request.

THE BLASTEEL MANUFACTURING COMPANY

Floor Clips and Floor Devices

GENERAL OFFICE
KANSAS CITY, MO.

AGENTS IN PRINCIPAL CITIES

For Bulletin Boards and Window Operators, see page C3334

Spearpoint Giant Floor Clips

Maintain solid and permanent anchorage of wood floors to concrete.

They save time, material, labor and floor load by eliminating the necessity of a fill between sleepers, reducing the dead load 18,000 lb. per 1000 sq. ft.

They provide an air space between the floor and concrete slab which acts as an insulator and safeguard against dry rot.

The three large bosses and two shoulders on each spearpoint give Spearpoint Clips the maximum anchorage. Spearpoint Clips are easier and more rapidly placed due to spearpoint shape of the flanges that insert in the concrete.

Made of 20 gauge galvanized metal for 2x2, 2x3 and 2x4-in. sleepers.

Spearpoint Standard Floor Clip

Where the super-strength of Spearpoint Giant is not essential or where building codes require a fill, the Spearpoint Standard gives unequalled anchorage at a still greater saving. For 2x2 standard sleepers only.

Blasteel Floor Joiners

The space provided within the anchor assures a tight threshold for all future time by simply tightening the screws as floors may shrink or wear.

All materials used in Blasteel Floor Joiners are rustproof and corrosionproof. Furnished in galvanized metal, brass or bronze.

Top plate in flat or bullnose shapes.

Standard widths $2\frac{1}{8}$ and $3\frac{1}{4}$ in. Other widths on specification.

Blasteel Floor Joiners are easily installed in either old or new buildings.

Stair Nosings

Improve the appearance of stairways, securely bind the tread covering, and protect it from curling and splitting. Provide a decorative safeguard against tripping. White metal and yellow brass.

Blasteel Beveled Brass Binding Strip

An attractive and economical binding for floor coverings. Made to accommodate all thicknesses. Highly recommended for aisles, at doorways, and for all exposed edges.

Security Brass Binding Bar

For binding the edge of applied floor coverings or mastic floors when joined to concrete where an offset is formed to receive it, at the same time protecting the edge of the concrete. Especially recommended for entrances, corridors, elevator mats at floor landings, etc. Enhances beauty of floor.

Detailed Information

Detailed information on these products will be gladly furnished.

THE BULL DOG FLOOR CLIP CO., INC.

108 North First Avenue, WINTERSET, IOWA

135 BRANCH REPRESENTATIVES AND 20 CONVENIENT DISTRIBUTING PLANTS

Product

BULL DOG FLOOR CLIP for anchoring Wood Floors to Concrete.

Advantages of Bull Dog Floor Clips

- (1) Save 5¢ per sq. ft. by eliminating the cost of material and labor for a concrete fill.
- (2) Can be placed for 1/2¢ or less each, and sleepers can be laid 50% faster than if anchored by a fill material.
- (3) Reduce dead weight 18,000 lb. per 1000 sq. ft. of floor area.
- (4) Give a perfectly firm, level floor. Solid bed and anchor overcome all possibility of floor buckling, doming, or squeaking.
- (5) Provide a dry air space which prevents strips or finished floor from rotting. No drumhead or hollow sound is produced by this air space.
- (6) Permit conduits and pipes to be placed on top of slab right under finished floor.
- (7) Where a fill is considered necessary, Bull Dog Floor Clips save considerable in construction

costs when used with any standard fill. Use of Bull Dog Junior Clip is recommended for a still greater saving.

Bull Dog Junior

For floors where ordinances require a fill, or where a light clip is desired, the Bull Dog Junior effects a still greater saving in anchoring wood floors to concrete. It is one-half the width of the regular Bull Dog Clip and is made in three sizes for 2, 3 and 4-in. sleepers. When the Junior Clip is used in conjunction with a fill, we suggest spacing 16 in. and 2 1/2 ft. which requires about 300 clips per 1000 sq. ft. of slab at a cost, including installation, of \$9.00. This cost is more than offset in the time and expense of bracing the strips, beveling and shimming sleepers, and a large saving in expense of fill which can be made of any cheap, inexpensive mix, sand or cinders. Samples of each of the three sizes will be promptly furnished any interested architect or contractor.

Nails Now Furnished without Charge.

A sufficient quantity of the correct size nails is packed in each case of Bull Dog Clips shipped. This assures the use of the right size nails and saves the user their cost.

NEW YORK, N. Y.

Aerocrete—A Light Weight Concrete

Aerocrete is highly porous light weight concrete made from portland cement and cinders or slag. It differs from ordinary cement in that about 70% of its volume is made up of evenly divided cells which give the material a structure that resembles a honeycomb.

This cellular structure is produced by a substance added to the cement, which, when mixed with water, liberates hydrogen gas throughout the concrete mass, thereby producing innumerable isolated gas cells.

The presence of these gas cells in the mass gives Aerocrete its remarkable qualities, viz.:

(1) **Lightness**—Aerocrete weighs only one-third as much as ordinary concrete.

(2) **Heat Insulation**—Recent tests conducted by Professors Chas. McKergow and H. S. Reilley of McGill University show that Aerocrete has lower heat conductivity than any fireproof structural building material on the market.

(3) **Sound Deadening**—Aerocrete, due to its cellular structure, effectively damps out sound and thereby retards sound transmission to a remarkable degree and its acoustic qualities are also excellent.

(4) **Strength**—Despite its

lightness Aerocrete develops a compressive strength of from 400 to 500 lb. per sq. in.

Uses for Aerocrete

Aerocrete is used for fireproofing of joists, girders and columns; for precast reinforced floor beams, for building blocks, roofing slabs, walls, partitions and for insulation of cold storage plants, heating furnaces and hot blast stoves.

Aerocrete can also be poured on the job.

Aerocrete Is Easily Worked

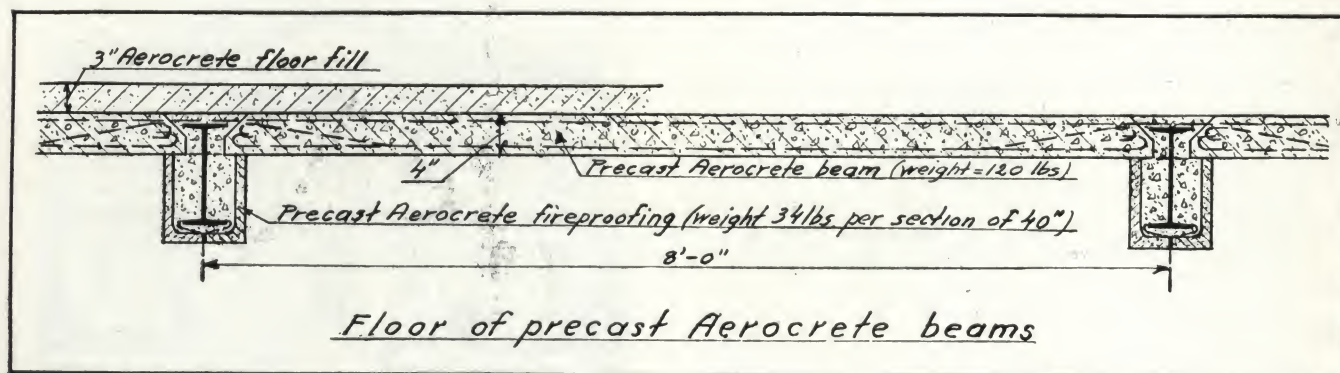

Aerocrete can be cut with a trowel, saw or chisel. It can be nailed or screwed to wood studs. On account of its lightness it is easily handled.

Licenses

Aerocrete has been used extensively in England and Canada for several years and is now being introduced into the United States. Licenses are being granted to responsible firms in various parts of the country to manufacture and sell Aerocrete.

Aerocrete Process is fully protected by patents.

Full particulars through the AEROCRETE CORPORATION OF AMERICA, 51 East 42nd Street, New York, N. Y.

THE NAILCRETE CORPORATION

Manufacturer of the Original Nailing Concrete

105 West 40th Street, NEW YORK, N. Y.

SELLING AGENTS IN ALL THE PRINCIPAL CITIES IN THE UNITED STATES

Product

NAILCRETE (Nailing Concrete). Patented—name registered.

Nailcrete (Nailing Concrete)

Nailcrete is a cementitious, fibrous, *all-mineral* fireproof compound, containing no animal or vegetable matter, no acids, alkalis or any substance injurious to metals, wood or other construction materials coming in contact with it.

Nailcrete is regularly supplied in burlap bags containing in each case the correct quantity for the mix used. It is to be mixed on the job with portland cement, screened sand and clean water, and screeded smooth and level. Complete instructions with each shipment.

Origin

Nailcrete has been in successful commercial use for more than 18 years. It was developed after extended laboratory research and tests conducted by Grosvenor Atterbury, F.A.I. A., collaborating with the Russell Sage Foundation in connection with their economic construction developments.

Advantageous Qualities and Physical Properties

Nailcrete is absolutely fireproof and verminproof; will not shrink, swell, or rot; is unaffected by dampness, a poor conductor of heat and an effective sound-deadener.

Nailcrete has the same compressive strength as 1-3-6 cinder concrete and is 20% lighter (Nailcrete weighs about 90 lb. per cu. ft.) thereby saving steel in building design. Its nailing properties are unsurpassed, as Nailcrete holds nails better than pine.

Coefficient of expansion, also setting and drying periods are substantially the same as those of cinder concrete. Nailcrete calls for the same precautions against freezing, quick drying, etc., as are necessary with ordinary concrete.

NAILCRETE SLABS—SAFE LOADS IN LB. PER SQ. FT.

Gross sectional area of steel in sq. in. per ft. slab	Thickness of Nailcrete above steel	Span in feet									
		1½	2	2½	3	3½	4	4½	5	5½	6
¾-in. Hy-Rib, Ribplex or equal, .061 sq. in.	2 in....	480	312	176	122
	2½ in....	232	161	118	91
	3 in....	144	110	87	70
¾-in. Hy-Rib, Ribplex or equal, .1407 sq. in.	2 in....	158	114	87
	2½ in....	230	171	130	102
	3 in....	233	177	139	113
	3½ in....	228	180	146	121	...
	4 in....	238	193	159	134

Nailcrete weighs about 90 lb. cu. ft. or 7½ lb. per in., 1 ft. square. Table based on WL/10. For WL/8 (or simple span), deduct 20% from above.

Brace self-centering lath to support wet Nailcrete.

Safe loads on spans above 6 ft. furnished on request.

Total live and dead load on tile roofs: 2-ft. slab, 66 lb.; 2½-ft., 70 lb.; 3-ft., 74 lb.; 3½-ft., 78 lb.; 4-ft., 82 lb. per sq. ft.

Uses of Nailcrete

Nailcrete is used without sleepers and without underflooring or sheathing, and is more durable than the ordinary construction using wood sleepers and cinder-concrete fill. It is especially suitable as a fireproof nailing base for floors, roof covering of various kinds, etc., as follows:

(a) **Subfloors**—Nailcrete is laid 2 in. thick (weight about 15 lb. per sq. ft.) as a subfloor on top of the structural slab or floor arch, to which is directly applied wood flooring, cork tile, etc., giving the floor

greater resiliency and making it more impervious to sound. (See specifications.)

(b) **Reinforced Floor Slabs for Metal Lumber**—Nailcrete is used 2 in. thick on top of metal lath placed on metal lumber or bar joist floor beams. In this case the Nailcrete acts as fireproof floor slab and as a nailing base for the finished wood floor. (See specifications and table of safe loads.)

(c) **Roof Coating**—A fireproof, rotproof nailing base 1½ to 2 in. thick directly on top of roof slab to receive tile, slate, copper, etc. (See specifications.)

(d) **Reinforced Roof Slab**—A poured-in-place construction on rafters of steel, metal lumber or bar joists. (See specifications and table of safe loads.)

(e) **Nailcrete Floor-Fill**—Under cement finish, terrazzo, marble, tile, etc., as a non-corrosive fill in place of cinder concrete. (See specifications.)

(f) **Plaster, Interior and Exterior**—For interior plastering especially for fireproofing, sound-insulating and as a nailing base for wood paneling; for exterior plastering of penthouse walls, skylight curbs, etc., to receive the sheet metal covering. (See specifications.)

Cost

Nailcrete installed costs less than good wood sleeper and cinder-concrete fill construction. (Estimates furnished by all contractors.)

Service and Supervision

Where practicable, THE NAILCRETE CORPORATION will send a representative to the job, without expense to the contractor, to instruct users in the proper installation of Nailcrete.

References

A list of Nailcrete installations will be furnished on request.

Nailcrete was used as a fireproof nailing base under all wood floors and also under copper roof

Specifications for Nailcrete

Note: Always specify Nailcrete by name.

Materials—Nailcrete shall be made with portland cement and sand strictly in accordance with the specifications of the manufacturer. All sand shall be sharp, clean, and screened through $\frac{1}{4}$ -in. mesh.

Preparatory Work—Immediately before Nailcrete is laid, the surface to be covered shall be swept broom-clean thoroughly wetted and grouted.

Setting—All Nailcrete shall be allowed to set properly before being walked on.

Note: Ordinarily 2 days in summer and 3 days in winter.

Nailcrete Subfloors—On structural floor construction Nailcrete shall be laid 2 in. thick and screeded, and, if necessary, troweled, to a level.

The wood floor is not to be laid until the Nailcrete has thoroughly dried out. Flooring to be nailed with 8d cut nails, driven at an angle of approximately 45°.

Note: For high class work specify (under the heading of Carpentry) 1 layer of tarred paper (not less than 2-ply) additional deadening felt, if desired, and the finish wood flooring to be used. Under-flooring is never necessary.

On Metal Lumber Beams—Cover the floors of rooms, etc. (specify which ones are to be covered), with metal lath secured directly to the beams (not over 2 ft. apart) and on top

of the metal lath put a bed of Nailcrete not less than 2 in. thick at the thinnest point, screeded level to receive the finish flooring specified under Carpentry.

Note: In high class work specify paper as above. Even in work of the highest class underflooring is unnecessary.

Nailcrete Roof Coating—The structural roof construction shall be covered with 2 in. of Nailcrete.

Note: If slate are thicker than $\frac{3}{4}$ in., consult THE NAILCRETE CORPORATION as to the thickness of the Nailcrete.

Reinforced Sloping Roof Slab—Cover steel rafters with self-centering lath (as specified by manufacturers) or pour in place fabric-reinforced Nailcrete slab in. thick. (See table for areas of steel and safe loads.)

Nailcrete Floor-Fill—Over structural arch apply in. Nailcrete Floor-Fill in accordance with manufacturer's specifications.

Plaster—Interior—Plaster interior walls to an approved finish, true and even as per instructions of THE NAILCRETE CORPORATION.

Exterior—Plaster the exterior of penthouse walls, skylight curbs, etc., with Nailcrete plaster 1 in. thick in 2 coats, scratch and finish, troweled (or floated) true and even.

Note: If the Nailcrete plaster is to be applied to gypsum blocks, the blocks should be covered first with proper bonding material, and the Nailcrete is then to be applied while the bonding material is still tacky.

Typical Examples of Nailcrete Construction

PORETE MFG. CO.

Manufacturers of Lightweight Concrete Products

346 Riverside Avenue, NEWARK, N. J.

Product

PRECAST PORETE SLABS for roofs and floors.
 Porete-Nailfill, a Nailing Concrete.
 Porete is covered by United States patents.

What Porete Is

Porete is portland cement concrete of uniformly honeycombed structure and combines the durability of concrete with the lightness of wood. It is made of portland cement and sand only. Porete is made of a very rich cement mix and the reinforcing metal is thoroughly coated and protected against corrosion.

Full Size Structure of Porete

Porete has about one-third the weight of solid concrete.

On account of the air cells which it contains, it is a good heat and sound insulator and a better fire resisting material than solid concrete, because of its low heat conductivity. Its permanency is equivalent to that of concrete and its strength improves with age.

Porete Roofs—2 ft. 8-in. Span

Porete roof slabs, 24x32x1 1/4 in. thick, are laid on steel purlins at 2 ft. 8-in. centers and are fastened to them with heavy metal clips. After all the slabs are laid, a thin cement grout is worked into the rough surface and this roof deck is then ready for the waterproofing which is ordinarily a tar and felt roof.

Porete for Steep Roofs, Used as a Base for Slate, Tile or Metal Roofing—Where slate, tile or metal roofing has to be nailed up, the Porete slabs are covered with 1/2 in. of Porete-nail finish. This is a mixture of portland ce-

ment and sand with a fibrous fireproof mineral material. This finish forms a tough resilient sheet which becomes integral with the Porete, greatly adding to its initial strength.

Advantages—Porete roof slabs are a factory controlled product, accurately reinforced. In combination with a cement finish which is applied in the field, they make a lighter fireproof roof than any other material. Porete roofs can be adapted to any roof design, flat or slanting. They are easily erected even in cold weather.

They weigh only 7 lb. per sq. ft., which is one-half as much as any other fireproof roof. A Porete roof will carry a live load of over 50 lb. per sq. ft. with a factor of safety of five. Buildings covered with Porete will cost less to heat, because Porete is a good heat insulating material.

Porete roof decks present a clean smooth stone finish on the underside. Due to their light weight there is a saving in the steel of the supporting trusses, especially on the larger spans.

AFCO SUSPENSION SYSTEM GYPSUM FLOORS and ROOFS.

GYPSUM TILE PARTITIONS.

Construction Service

All above constructions are installed in the building by our own organization consisting of country-wide crews of mechanics, especially trained in these types of work and available anywhere on short notice. Immediate service, correct and rapid installation are assured.

Engineering Service

A complete engineering department is at your service for consultation and assistance in design and construction. Architects' specification folders covering any of above and giving complete design information, and details will be sent upon request.

Afco Reinforced Gypsum Nailing Tile

Description—Solid precast, lengths of 30 in. by widths of 12 in., thickness of 3 or 4 in., consisting of calcined gypsum and wood fibre reinforced with electrically welded galvanized wire mesh. The wood strips are anchored in the tile and beveled to give additional security. These strips provide a positive nail-holding base to which the slate or ornamental tile may be nailed direct or to wood cross sleepers attached as shown in cut below. We recommend the use of cross sleepers. This

tile provides an absolutely positive nailing base even under excessive moisture and circumvents the trouble previously encountered in ordinary types of plain gypsum roof tile, which possesses little nail-holding power when dry and practically none when damp.

Steel Framing—Owing to the light weight of Afco Gypsum Nailing Tile, 16 lb. per sq. ft., a material economy in structural steel framing is permitted.

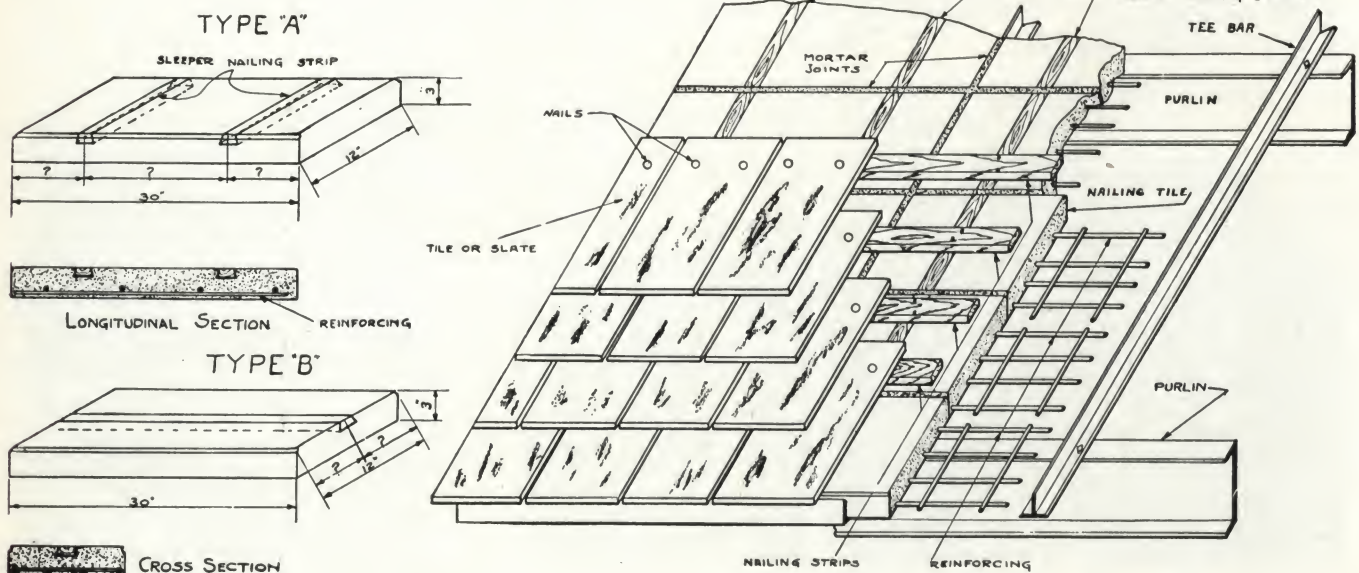

Insulation—Gypsum has the lowest conductivity of any structural fireproof building material, and heat penetration in summer and heat loss in winter are reduced to a minimum.

Strength—The Detroit Testing Laboratory reports show that Afco Nailing Tile develops strength withstanding ultimate uniform loads of from 488 to 520 lb. per sq. ft. or, using the factor of safety of 4, safe working loads of from 122 to 130 lb. per sq. ft.

Specifications—All roofs, as shown on plans, unless otherwise noted, shall be constructed of 3x12x30 in. solid Afco Gypsum Nailing Tile. Tee irons (see schedule for proper sizes) shall be laid directly on and securely fastened to the purlins. Tee irons shall be spaced 30 $\frac{3}{4}$ in. on centers and shall be furnished and erected by this contractor. The tile shall be laid tightly together on tee irons without mortar and after placing tile, all joints shall be filled with gypsum mortar mixed in accordance with the manufacturer's specifications. The entire surface shall be left true and even for installation of finish roof covering.

TEE IRONS REQUIRED FOR VARIOUS PURLIN SPANS

Purlin span	Size of tee	Weight
Up to 5 ft. 3 in.	2 $\frac{1}{4}$ x 2 $\frac{1}{4}$ x $\frac{1}{4}$ in.	4.1 lb.
5 ft. 3 in. to 6 ft. 0 in.	2 $\frac{1}{4}$ x 2 $\frac{1}{4}$ x $\frac{1}{8}$ in.	4.9 lb.
6 ft. 0 in. to 6 ft. 6 in.	2 $\frac{1}{2}$ x 2 $\frac{1}{2}$ x $\frac{1}{8}$ in.	5.5 lb.
6 ft. 6 in. to 8 ft. 0 in.	3 x 3 x $\frac{1}{8}$ in.	6.7 lb.

Afco Suspension System Gypsum Floors and Roofs

Description—This construction employs a principle of proven value and is practical for any type of building. Load is carried by cables in suspension, gypsum fill being used only to hold the cables rigidly in place. Cable section is constant, variations in purlin spacing and in floor or roof loads being provided for by cable spacing. Compressive strength of gypsum is disregarded and cable stresses are figured by standard formulae.

Rapid Erection—Fill sets in 15 minutes and the centering, which is of simple type wood form construction, may be removed within an hour. Other trades follow immediately with their work.

Insulation—Fill, principally calcined gypsum, eliminates condensation on undersurface, provides against heat loss in winter and penetration of heat in summer.

Economy—Light weight permits economy in structural steel, insulation qualities reduce amount of heating equipment required and cost of operating same.

End Bay Bracing—To take cable tension which exerts a pull on the end bay beams, it is necessary to include light truss bracing in structural steel contract. Our architect's folder gives full information—sent on request.

**Afco Combination Plaster Board Gypsum Roofs**

Description—Construction consists of subpurlins, either tee irons or light rail sections, spaced 32½ in. on centers, and clipped to main purlins. Heavy duty ½-in. plaster board is laid on and supported by bottom flanges of rails. Galvanized electrically welded reinforcing mesh of No. 11 main wires on 4-in. centers, and No. 12 spacer wires on 8-in. centers, is laid on top of the plaster board. Fill, consisting of standard gypsum mix, is poured, screeded and troweled to an even surface to receive waterproof covering. It is suitable for roofs with a pitch not greater than 45°.

Economy—This construction makes a definite saving in structural steel, due to its light weight. Insulating value of the roof reduces initial cost of heating equipment and reduces fuel bills.

Appearance—Undersurface presents true and uniform paneled appearance, showing neither form marks nor nailheads, and may be plastered or decorated in any color scheme, if desired.

Rapid Erection—These roof decks can be poured as fast as steel and masonry walls are completed. They set in 15 minutes and finish roof covering may be applied immediately.

Insulation—Same advantages as other roof types on this and preceding page.

Fireproofing—The construction comprises only materials whose fire-resisting qualities have long been established.

Strength—Columbia University tests of Afco Plaster Board Gypsum Decks reveal strengths that afford a factor of safety far in excess of standard practice—this factor of safety being much greater than that of the ordinary design of the structural steel framework of the building.

Products

Manufacturers of BONANZA "CEMENTILE"—a reinforced cement tile roofing.

TRADE-MARK

Description of Bonanza "Cementile"

Bonanza "Cementile" are very large, light, steel reinforced cement roofing tile furnished in three distinct types; namely, Interlocking, Flat, and Channel, besides such necessary fittings as ridge tile of various types, skylight or glass insert tile, flashing tile, collar tile, etc., all factory made and cured—a specialized product, brought to its highest state of development.

The tile are laid directly on open steel roof purlins (which are spaced on a span suitable for the type of tile selected).

In no case is sheathing or other base support required. This eliminates excessive weight and insures greatest economy in design of the supporting structure.

All in all, Bonanza "Cementile" roofs are roofs of economy and quality, speedily laid, with guaranteed results backed by our established reputation as manufacturing and contracting engineers over a period exceeding 25 years.

Bonanza Interlocking "Cementile" are designed for pitched roofs. Laid directly on purlins spaced approximately 4 ft. apart, they are fireproof and waterproof, the finished surface having a particularly pleasing red Spanish tile effect. Like Bonanza Flat "Cementile" and Bonanza Channel "Cementile" they are very strong and light.

Bonanza Flat and Bonanza Channel "Cementile" are designed for flat roof construction, or for pitched roofs where it is desired to waterproof with composition covering. These tile are laid directly on purlins; the 1½-in. Bonanza Flat "Cementile" for standard spacing of 5 ft., and the Bonanza Channel "Cementile" standard 8-ft. spans, are a combination of tremendous strength and lightness that eliminates all form work and assures speed in erection with positive results.

Lehigh Valley R. R. Co. Pier Shed, Jersey City, N. J.
110,000 sq. ft. of Bonanza Flat "Cementile" ready for waterproof covering

Advantages of Bonanza "Cementile"

Economy—Being laid directly on the roof purlins, the absence of roof boarding, nailing strips and other forms of fastenings makes the initial cost reasonable. Maintenance charges are eliminated, thus making the first cost usually the last.

Weight—These tile are designed along economical lines, reducing the dead load on the steel structure to a minimum.

Strength—In conformity with the standard purlin spacing, Bonanza "Cementile" roofs will sustain such roof loads as are usually encountered. Breaking load tests made at Columbia University for the New York Building Department, showed as high as 350 lb. per sq. ft. under a uniformly distributed load on the standard spacing.

Adaptability—Bonanza "Cementile" will be found suitable for any type of roof construction and of any size.

Erection—An experienced and capable field force insures absolute satisfaction. "Cementile" roofs can be laid regardless of temperature or climatic conditions, thus eliminating delays.

Weatherproof and Fireproof—Bonanza "Cementile" are impervious to water and the elements, are proof against fire, and are everlasting under ordinary conditions.

Interlocking "Cementile"

Designed for pitched roofs, forming in itself a finished, watertight and fireproof covering.

Standard tile is 26 in. wide by 52 in. long (24x48 in. exposed surface) and 1 in. thick, properly reinforced with a galvanized steel fabric. It develops an ultimate breaking load capacity of 350 lb. per sq. ft.

The tile are made up as single units with no loose connections. The side "roll" of one tile overlaps the "rabbet" of the adjacent tile. All joints are properly sealed with "Lastik" Cement. A 4-in. lap is provided on each row of tile by the row above, which is staggered.

Watertown Arsenal, Watertown, Mass.
Finished Bonanza Interlocking "Cementile" Roof with Bonanza Glass Insert "Cementile." This is part of a total installation of ten buildings with an area of 470,000 sq. ft.

The tile are hooked in place on purlin flanges by means of a continuous 1-in. offset at top of each tile. The Bonanza Wire Glass Insert Interlocking "Cementile," which interchange with the standard tile, provide any lighting effect demanded.

Guaranteed to carry a uniformly distributed load of 250 lb. per sq. ft. over a 4-ft. span.

DIMENSIONS AND WEIGHTS OF INTERLOCKING "CEMENTILE"

Size of tile	26x52 in.
Thickness of tile	1 in.
Surface exposed	24x48 in.
Weight per sq. ft.	14 lb.
Weight per sq. ft. of finished roofing	16 lb.
Number of tile per square of roof (100 sq. ft.)	12½

Roof Design—Minimum pitch desirable for slope of roof is $\frac{1}{5}$, which is $4\frac{1}{8}$ in. to 1 ft.

In order to arrive at the proper purlin spacing always start at the eaves; then use standard spacing of 3 ft. 10 in. to 4 ft. $\frac{1}{2}$ in., as conditions call for. Any short spacing should be placed at the ridge; should this spacing be less than 1 ft. 4 in., special 60-in. tile should be used at the eaves. Steel channel purlins should be provided, held in alignment by sag rods.

Flat "Cementile"

Designed for both flat and pitched roofs; the application of a standard composition roofing is required to make roof watertight.

Standard Bonanza Flat "Cementile" are $1\frac{1}{2}$ in. thick, 24 in. wide, and 60 in. long, and are always carried in stock for immediate shipment. Where necessary, special tile are made to order for spacing over or under 60 in.

Ends have an offset which is laid on flange of I-beam purlins, after which joints are properly pointed, preparatory to application of composition roofing. Bonanza Flat "Cementile" are properly reinforced.

Guaranteed to carry a uniformly distributed load of 200 lb. per sq. ft. over a span of 5 ft.

DIMENSIONS AND WEIGHTS OF FLAT "CEMENTILE"

Thickness of tile	1½ in.
Size of standard tile	24x60 in.
Surface exposed	24x60 in.
Weight per sq. ft.	17 lb.
Weight per square of roof	1700 lb.

Channel "Cementile"

Designed to meet the demands of the present tendency to use extra wide spans in flat roof construction. Also used extensively on sawtooth roofs.

Standard Bonanza Channel "Cementile" is 18 in. wide and 96 in. long; channels are $1\frac{3}{8}$ in. thick at flanges and 1 in. thick at web. Special tile are made to order for spans over or under 96 in.

Ends are laid directly on flange of I-beam purlins, joints are then properly pointed and entire roof deck covered with some form of composition roofing. Bonanza Channel "Cementile" are properly reinforced.

DIMENSIONS AND WEIGHTS OF CHANNEL "CEMENTILE"

Depth of tile	3½ in.
Thickness of tile	Flanges $1\frac{3}{8}$ in., web 1 in.
Size of standard tile	18x96 in.
Surface exposed	18x96 in.
Weight per sq. ft.	19 lb.
Weight per square of roof	1900 lb.

Service

Our engineering department renders free service to owners, engineers, architects and contractors whenever desired. Send your problems and preliminary plans during the early stages of the work. Our experience of 25 years allows us to offer suggestions as to the most economical purlin layout. Upon receipt of preliminary or finished drawings, either approximate or definite proposals will be furnished, as may be desired.

Bonanza "Cementile" roofs are erected preferably by experienced and efficient crews maintained by the company.

All materials and workmanship fully guaranteed.

FEDERAL CEMENT TILE COMPANY

Fireproof Roofs

608 South Dearborn Street

CHICAGO, ILL.

Federal Interlocking Tile for Pitched Roofs

Form a complete waterproof roof, entirely eliminating composition covering.

Their attractive red color enhances appearance of building.

Federal Glass Tile

When used in combination with Federal Interlocking Tile for top lighting form an ideal "daylight roof." Can be so distributed as to admit light over entire floor space, or concentrated on any technical or exacting operation. Glass embedded in concrete during manufacture in such manner as to prevent cracking of glass.

Federal Flat and Channel Deck Slabs

Designed for flat and pitched roofs. These types require some form of composition covering. Their light weight and long span effect a structural steel saving, and they eliminate costly labor and materials incidental to roofs poured or plastered on the job.

Federal Cork Insulated Slabs

Afford a splendid super-insulation. The cork is entirely encased on all sides with impervious concrete.

Federal Nailing Concrete Tile

Form a concrete deck to which can be readily nailed slate, small tile or other ornamental roofing. Made of fireproof and waterproof concrete.

Federal Interlocking and Flat Slabs on Ford Motor Co. Assembly Plant, Memphis, Tenn.

The Roof for Permanence

Federal Tile are made of the most indestructible of all materials—reinforced stone-concrete. They are not affected by heat, cold, ice, snow, fire, water, acid fumes, gases, or any other destructive forces. They actually grow stronger with age. Laid directly on structural steel, they make a light weight, fireproof construction. They require no painting, repairing or other maintenance. They last as long as the structure. The tile are properly reinforced and tied together with wire mesh to carry a load well above the building code requirements of the larger cities. The unit system, with plastic cement at the joints, makes every slab free to come and go with vibration, contraction and expansion. Federal Cement Tile are the most economical of all roofs when the cost is figured over a period of years.

A list of representative installations will be furnished on request.

Service and Structural Details

All Federal roofs are installed and fully guaranteed by the manufacturer. Federal engineers are structural experts and will assist architects and engineers in laying out steel work to carry Federal Tile. This service involves no charge or obligation.

Federal Concrete Cribbing

These pre-cast, reinforced concrete units form an economical and ideal construction for retaining walls and embankments. The installation cost is moderate and once installed, they will last indefinitely.

Federal Channel Slabs Forming Roof Deck and Ceiling on Union Station Concourse, Chicago

Standard Specifications

General—All tile to carry approximately 300 lb. per sq. ft. breaking load, uniformly distributed when resting on supports spaced the same as the purlins. No cracked or broken tile or tile with broken corners or warped tile will be permitted to be placed in the roof. All tile to be as nearly perfect as good workmanship will permit.

All tile to be natural water and air cured under cover where a constant temperature is maintained of not less than 60° F.

This contractor shall make up and submit for approval pre-cast slab details based on the steel fabricator's shop drawings as well as the architect's design drawings, before starting manufacture of material.

All tile are to be erected by the manufacturer furnishing the material in a thorough workmanlike manner.

Interlocking Tile—The pitched roof is to be Pre-cast Reinforced Concrete Tile, Interlocking Type, with the necessary trimmings, to make a complete and satisfactory job.

All tile to be composed of an approved brand of portland cement and the highest grade of washed torpedo sand, in a mixture of 1 part of cement to 2¾ parts of sand accurately graded and thoroughly mixed and mechanically tamped and kneaded, so as to obtain the greatest possible density and watertightness. Each slab is to be reinforced with a sheet of galvanized cold drawn wire mesh, the longitudinal wires spaced not more than 2 in. apart and cross wires woven around the longitudinal wires.

The sheet of mesh reinforcing shall be mechanically straightened before being placed in the slab so that it can be accurately centered in a plane and be protected by ½ in. of dense, impervious concrete.

The exposed surface of the tile to present a permanent red color and this color, a mixture of iron oxide and cement, to penetrate the top half of the slab. The top surface to be thoroughly troweled, giving same a smooth and uniform finish.

The longitudinal joints to be of plastic made with a high grade oil cement and a weather cap coat of highest grade elastic compound. The joint to conform to detail shown on the drawings.

The lap or cross joint to be formed of a high grade oil cement. Butter the upper end of each course of tile as laid, then install course above producing a squeeze joint as overlap.

Special tile to be furnished where necessary; these tile to be detailed and manufactured to interlock and fit in with adjacent tile without field cutting.

Glass Tile—Top lighting shall be provided by Pre-cast Reinforced Concrete Tile with Glass Inserts. Locate as shown on the drawings. These tile are to be made so as to be interchangeable with the standard 52-in. interlocking tile.

The mix, material and workmanship of these tile shall be the same as the standard interlocking tile. A sheet of ¼-in. wire glass 21x35 in. is to be embedded in the concrete during the process of manufacture of the tile, thus becoming an integral part thereof.

The four edges of the glass are to be triple dipped in a special asphalt compound, forming a cushion on all four sides, to allow for expansion and contraction.

A condensation gutter and weep hole formed in the concrete at the lower edge of glass is to be an integral part of the glass tile.

Flat Slabs—The flat roof decks and gutters are to be Pre-cast Reinforced Concrete Flat Slabs, 24 in. wide, of a length to fit purlin spacing and not less than 1½ in. thick for the standard 5-ft. slabs, composed of an approved brand of portland cement and the highest grade washed torpedo sand in a mixture of 1 part of cement to 2¾ parts of sand accurately graded, thoroughly mixed, tamped and kneaded so as to obtain the greatest possible density.

Each slab is to be reinforced with a sheet of cold drawn wire mesh, the longitudinal wires of which shall be spaced not more than 2 in. apart and cross wires woven around the longitudinal wires.

The under side of the tile shall present a smooth surface free from cracks or form marks, and shall be of a uniform natural gray cement color.

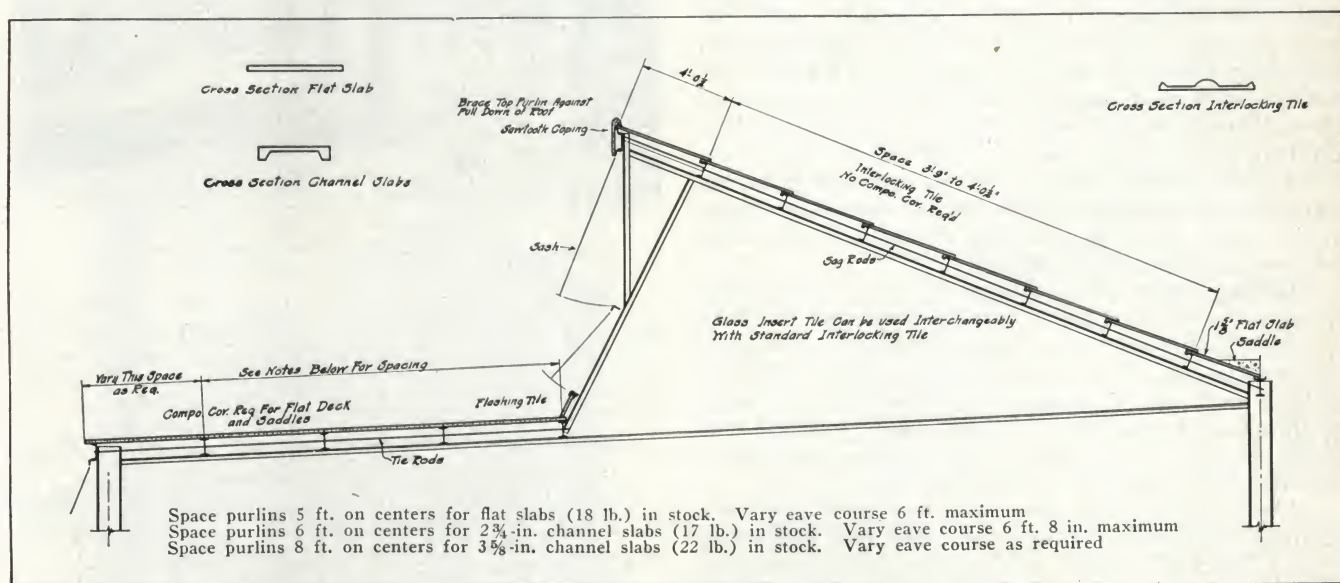

All joints of the flat slabs are to be cemented on the upper side with an approved brand of asphaltic cement and present a smooth surface ready for the application of the composition covering.

Channel Slabs—The flat roof decks are to be Pre-cast Reinforced Concrete Channel Slabs composed of an approved brand of portland cement and the highest grade of washed torpedo sand in a mixture of 1 part of cement to 3 parts of sand accurately graded and thoroughly mixed and vibrated so as to obtain the greatest possible density. Each leg is to be reinforced with one deformed bar accurately centered so as to have at least ½ in. of dense, impervious concrete on all sides. The web of the slab is to be reinforced with a sheet of triangular cold drawn wire mesh accurately centered.

All joints of the channel slabs are to be cemented on the upper side with an approved brand of asphaltic cement and present a smooth surface ready for the application of the composition covering.

The Federal Blue Print Book "Roof Standards"

The Federal Blue Print Book "Roof Standards," containing 28 pages of details of roof construction, will be sent on request. The drawing below is a typical illustration.

Product

Manufacturers and erectors of "GYPSTEEL"
PRE-CAST and POURED-IN-PLACE FLOORS and
ROOFS.

Also, "Ribrock" Partition Blocks.

"Gypsteel" Pre-cast Long Span Floors (Patented)

"Gypsteel" pre-cast floors economically combine the calculable strength of structural steel with the unequalled fire protection and lightness of gypsum. This floor construction consists of *standard sections of rolled steel channels*, spaced 30 in. on centers, on which are laid pre-cast gypsum floor slabs $2\frac{1}{2}$ in. thick, and from which are suspended ceiling slabs of the same material, 2 in. thick.

"GYPSTEEL" PRE-CAST FLOOR

These channels, being of structural steel, are designed for the required loads in accordance with the usual practice, and may be used for any spans between supporting girders or walls up to 24 ft. They are supported at girders by means of standard web connections. These channels are *not coped*, but are framed with their top flanges 2 in. below the top flanges of the girder.

Where columns and girders are not required, these channels may be supported by the exterior and interior walls, their ends being built into the walls as the latter are erected, in the usual manner.

Ceiling Slabs—The ceilings consist of "Gypsteel" pre-cast slabs 2 in. thick, 2 ft. 6 in. in length and 2 ft. in width, composed of the highest grade, scientifically calcined gypsum, with which is incorporated a small percentage of binder that imparts to the slab a peculiar toughness and elasticity. These slabs perform the double function of providing a flat ceiling underneath and completely *fireproofing* the channels.

These ceiling slabs are reinforced with steel bars running lengthwise through the slabs and projecting from either end. When erected, these projecting bars pass through slots in heavy steel hangers clamped to the top flanges of the channels, suspending the slabs and yet holding them tightly against the soffits of the channels. Generous slots are formed where the slabs abut each other, at both sides and ends, by means of rabbets, which slots are filled solidly with gypsum grout, completely

sealing them and preventing the passage of any heat through the joints.

The ceiling is then immediately ready for brown and finish coats of plaster—*no scratch coat* being necessary as required

for metal lath and other materials.

Floor Slabs—
"Gypsteel" floor slabs consist of the same composition as the ceiling slabs. Like the latter, they are pre-moulded at the factory and shipped to the job ready to erect. They are $2\frac{1}{2}$ in. thick, 2 ft. in width and 2 ft. 6 in. in length.

ERECTION OF "GYPSTEEL" CEILING SLABS
Grouting to follow

"GYPSTEEL" PRE-CAST FLOOR
Christopher Columbus High School, Binghamton, N. Y.
TIFFANY & KALEY, Architects

These slabs are reinforced with $\frac{3}{16}$ -in. cold drawn wire rods (uniformly and accurately located in accordance with accepted engineering formulae), which emerge from the ends of the slab within $\frac{1}{2}$ in. of the top surface, projecting about $2\frac{1}{2}$ in.

CROSS SECTION "GYPSTEEL" PRE-CAST FLOOR

When these slabs are set in place upon the steel channels, the projecting ends of the opposite rods in

abutting slabs are tied together by a mechanical device which draws them up taut at these connections, *making the reinforcement continuous.*

"GYPSTEEL" PRE-CAST FLOOR
Erecting floor slabs

As the ends of the slabs are rabbetted where the rods emerge, these ties lie in a depression which is filled with a gypsum grout, firmly embedding the ties and smoothed off flush with the top surface of the slabs. The floor is then ready to receive cinder fill and cement finish, or wood sleepers and wood floor, as desired.

Girder Fireproofing—

Where the floor channels are supported by girders, the projecting webs and flanges of the latter are fireproofed by means of "Gypsteel" pre-cast slabs, 2 in. in thickness, applied to the soffits of the girders. These slabs have embedded in them $\frac{3}{4} \times \frac{1}{8}$ -in. flats, the ends of which project through the upper surfaces and are clamped over the girder flanges. Plastic gypsum is then deposited in space between top surfaces of these soffit-slabs and adjacent ceiling slabs, and is troweled off square and flush with outside edges of soffit-slabs.

"GYPSTEEL" PRE-CAST FLOOR

First National Bank and Northampton Trust Co., Easton, Pa.
HOGGSON BROTHERS, New York, N. Y., Architects

Principal Advantages of "Gypsteel" Pre-cast Floors

Economy—They are the most economical type of first class fireproof floor construction which can be employed where flat ceilings are required.

Strength—Their load carrying capacity is accurately calculated upon the strength of the supporting rolled steel channels, spaced 30 in. on centers. The ability of the "Gypsteel" pre-cast floor slabs to transmit the load to these channels was conclusively proven by tests conducted by Columbia University Testing Laboratory for the Bureau of Buildings, New York City, in which *concentrated loads* were applied by machine at the *third points* of one of the 2 ft. 6-in. spans for the full width of the slab. Failure did not occur until the load had reached *1482 lb. per sq. ft.*, equal, approximately, to 2000 lb. per sq. ft. uniformly distributed. These floors may, therefore, be safely designed for total loads up to 250 lb. per sq. ft. *with a factor of safety of 6 on the third-point loading*, or a factor of safety of approximately 8, based upon a uniform loading.

Fire Resistance—"Gypsteel" pre-cast floors have successfully passed the standard fire, load and water tests required by the principal cities of the United States for first class fireproof floor construction. These tests consist of the subjection of the floor to a fire for 4 hours at 1700° F., carrying a live load of 150 lb. per sq. ft., followed by the application, for 10 minutes, of a hose stream from a $1\frac{1}{8}$ -in. nozzle at 60-lb. nozzle pressure. The following is quoted verbatim from the official report of the Columbia University Testing Laboratory to the Bureau of Buildings of New York City, viz.:

"The floor slabs proper were not affected by the heat. The maximum temperature reached during the test on the underside of these slabs (the space between the floor and ceiling slabs) was about 315° F. A short piece of wood, 1x2 in. in cross section, found between the floor and ceiling slabs, and which had been there during the entire test, was only blackened in part, giving further proof of the low temperature during the test directly above the 2-in. ceiling."

The maximum deflection recorded during this test, at the center of the 18-ft. floor span was .82 in. Fifteen minutes after the water was applied, this had recovered to .62 in. After the removal of the load of 150 lb. per sq. ft. the final deflection was .19 in.

Lightness—"Gypsteel" pre-cast floor construction (including channels) is usually not only lower in first cost than any other type of fireproof floor with flat ceiling underneath for a given span and load, but its extreme lightness in weight invariably permits of a substantial saving in the tonnage of girders and columns.

TABULATION OF DEAD LOADS

	Lb. per sq. ft.
Channels (average)	5
"Gypsteel" floor slabs	12
"Gypsteel" ceiling slabs	9
2-in. cinder fill	10
Wood floor	4
Plastering (no scratch coat)	4
Total	44

Note: If cement finish instead of wood floor is used add 8 lb. per sq. ft.

Time Saving—The "Gypsteel" floor and ceiling slabs being in standard sizes, are carried in stock at the factory and arrive at the job dry and ready to erect. There is *no form work*. As the slabs are dry when set, the *ceiling could be plastered the same day*, if desired. And as there is *no water entering into the construction* (except the small amount used in the grouting), there is *no drying out to delay the finishing of the building*.

"Gypsteel" Pre-cast Roofs (Patented)

"Gypsteel" pre-cast roof construction is designed upon the suspension-bridge principle. It is, in effect, a monolithic roof after the erection is completed. The slabs are moulded in steel forms, into which the steel cables are placed and put into uniform deflection and tension by means of deflection rods restrained at the sides of the moulds. The cables are securely anchored to the moulds at points beyond the ends of the slabs, being removed from this anchorage when the gypsum has set, each cable emerging from the ends of the slab within $\frac{1}{2}$ in. of the top surface, and projecting about 2 in.

**"GYPSTEEL" PRE-CAST ROOFS**

Details of design, cable ties, anchorage, grouted end and side joints and anchor slots

**"GYPSTEEL" PRE-CAST ROOFS**

Showing perfect mechanical anchorage of steel in slabs to the steel framework of building, independent of the gypsum

When these slabs are set in place on the purlins, with their ends abutting, the projecting ends of the opposite cables in each slab are tied together by a mechanical device which draws them up taut at these connections; and as the ends of the slabs are rabbetted where the cables emerge, these ties lie in a depression filled with a grout of the same composition, firmly embedding the ties and troweled off flush with the top surface of the slab.

Innumerable load tests which have been made on "Gypsteel" pre-cast roof construction have shown in every instance, that it will develop more than the factor of safety of 4 upon which the supporting steel cables are designed, the cable ties holding firmly until the ultimate strength of the steel in tension has been reached.

SAFE TOTAL LOADS PER SQUARE FOOT, PRE-CAST ROOF CONSTRUCTION

Slab width, in.	Cable spac., in.	Number cables per slab	Distance between supports center to center, ft.-in.													
			4-0	4-3	4-6	4-9	5-0	5-3	5-6	5-9	6-0	6-3	6-6	6-9	7-0	
24	4	6	136	122	108	98	88	80	72	66	61	57	54	50	46	
	3.43	7	159	142	126	114	102	93	84	78	72	67	63	59	55	
21	4.2	5														
	3.5	6														
18	3	7														
	2.62	8														
	3.6	5														
	3	6														
	2.57	7														

$W = 1152 Td \div bL \sqrt{L^2 + 16d^2}$ where W = safe load in lbs. per sq. ft.
 T = cable strength = 0.0274 (area of $\frac{3}{8}$ -in. cold drawn steel-wire rods) \times 20,000 (unit working stress) = 552 lb.; d = deflection of wires in inches;
 b = cable spacing in inches and L = clear span in inches.

Slab thickness in all cases, 3 in., weight 14 lb. per sq. ft.

Note: While this table is not extended beyond the usual range of roof loads, slabs will be designed and furnished for any greater load capacities which may be desired, in order to meet special conditions. This is accomplished by decreasing the cable spacing for any given span.

**"GYPSTEEL" PRE-CAST ROOF**

Part of half million feet of "Gypsteel" roof at new plant of Western Electric Company, Kearny, N. J.

Advantages of "Gypsteel" Roof Construction

Economical First Cost—Its extreme lightness in weight and adaptability to wide purlin spacings effect substantial savings in the total steel tonnage of the purlins, trusses and columns, making it the most economical of any first class type of roof construction.

Saving in Heating—The "Gypsteel" composition used in the slab is the most remarkable non-conductor of heat of any known structural material. It thus minimizes heat loss through the roof, *reducing the consumption of coal annually*, and effecting a further saving in the initial cost of the heating plant.

Preventing Condensation—"Gypsteel" roof construction pre-insures against the forming of condensation on the underside of the roof; and as the full depth of the slab (3 in. minimum) *passes over the tops of the purlins*, it also thoroughly insulates the supporting steel work.

Time Saving—"Gypsteel" pre-cast slabs are manufactured at the factory. Being ready for shipment when the erection of the steel work begins, the speed of installation is limited only by the progress of the steel erection ahead of it, and the slabs being dry the water-proofing follows the slab erectors just as closely.

Elasticity—"Gypsteel" successfully resists the most severe vibrations without cracking.

Corrosionproof—"Gypsteel" composition has been proved by more than 20 years' experience to be a perfect preservative of the incased steel against corrosion.

Non-expansive—"Gypsteel" roofs will neither expand nor contract, and are therefore free from cracks, spalling and internal stresses which frequently occur from this cause in concrete and other similar materials.

**"GYPSTEEL" PRE-CAST ROOF**

Close up view of cable ties. Note that grouting is used in the side as well as end joints, giving in effect, a monolithic slab construction

Attractive Appearance—"Gypsteel" roofs give a much more attractive appearance underneath than any other type of roof remaining unplastered, since the slabs are factory moulded on rubber mats, leaving a smooth, even surface underneath.

Replacement of Old Roofs—The replacement of old roofs is readily accomplished by the use of "Gypsteel" pre-cast construction with a minimum of annoyance to the work in process below. Its lightness in most cases renders increased steel work unnecessary over that which would be required for the support of wood, etc.

"GYPSTEEL" PRE-CAST ROOF
Girard Pier No. 3, Philadelphia, Pa.

Philadelphia's modern fireproof piers are roofed with "Gypsteel"

Poured-in-place Construction

Where flat ceilings are not required and floor or roof beams may be spaced not to exceed 8 ft. on centers, "Gypsteel" poured-in-place floor and roof construction combines the highest degree of fire resistance with economy. Its lightness (12 to 16 lb. per sq. ft.) permits of a substantial saving in the tonnage of steel. The design of "Gypsteel" poured-in-place construction is based upon the *principle of the suspension bridge*. Cables of cold drawn steel wire are spaced from 1 to 3 in. apart (depending upon the spans and loads) and are securely anchored at both ends of a series of beams by means of bars and anchors of a section of metal sufficiently heavy to develop the ultimate strength of the cables in tension. The cables are put into uniform deflection and tension between each pair of beams by means of continuous steel deflection rods.

TYPE 2. POURED-IN-PLACE FLOOR OR ROOF

"Gypsteel" composition is then poured-in-place between the beams, upon wood forms or centering, and is brought to a level surface about $\frac{1}{2}$ in. above the top flanges of the purlins. It is then ready to receive the fill and finished floor on top. The projecting webs and flanges of the beams and girders are also incased in the same composition poured at same time as the floor slab.

This "Gypsteel" composition consists of the highest grade, scientifically calcined gypsum with which is incor-

porated wood fiber or chips to serve as a binder and impart to the slab its peculiar toughness and elasticity.

The strength of a "Gypsteel" poured-in-place floor or roof can be proved by accepted engineering formulae, as the desired live and dead load capacity of the slab is calculated upon the structural value of the securely anchored steel cables, in suspension, under a factor of safety of 4.

Installation

"Gypsteel" construction is installed by our own field organization under competent foremen and superintendents of many years' experience. When desired, however, contracts will be taken for furnishing "Gypsteel" pre-cast slabs f.o.b. cars factory, with freight allowed to destination—we loaning one of our experienced working foremen to the contractor or owner to supervise the erection, for which no charge is made other than his actual time and expenses.

Estimates and Designs

Complete proposals for furnishing and installing "Gypsteel" floors and roofs will be promptly furnished on request. When it can be done conveniently, we suggest sending plans to our nearest sales office. This permits our Engineering Department to go over all of the details of the steel design and incorporate in our proposal an estimate of the total tonnage of steel which can be saved by reason of the lightness in weight of "Gypsteel."

Where plans have not yet been drawn, our Engineering Department will gladly co-operate in the preparation of the steel design to develop the maximum economy by the use of "Gypsteel" construction. This service is gratis, and imposes no obligation whatsoever upon the architect, engineer or owner.

Bulletins

Complete bulletins, containing full designing details, will be gladly sent on request.

Service

Our mills, located at advantageous points, insure prompt delivery for any quantity.

An Engineering and Construction Department is maintained to assist engineers and architects in designs and estimates without obligation. We will gladly submit erected bids on Pyrobar or Pyrofill roofs for new jobs, re-roofing jobs or on placing an insulation deck on your present roof.

Gypsum Roof and Floor Construction

Description—We have several types of gypsum construction for floors and roofs, which divide into two general forms—precast Pyrobar roof tile, and poured-in-place Pyrofill floor and roof construction.

Pyrobar roof tile are made of "Structolite," a specially prepared dense structural gypsum, reinforced with electrically welded, galvanized steel mats. Manufactured in two general types: long span hollow and 30-in. types, either solid or hollow.

Pyrofill consists of gypsum stucco to which is added as a binder or aggregate a small percentage of fibre, usually soft wood shavings. The two general types of Pyrofill construction are: (1) Pyrofill monolithic construction, which is poured on wood forming similar to that used for concrete construction and reinforced as a "suspension" system with twisted wire cables. (2) Sheetrock Pyrofill construction, which is poured on permanent Sheetrock forms or centering resting on light rail or other steel framing and reinforced with a welded wire mat.

Advantages—Strength—Pyrobar roof tile are designed to carry 50 lb. per sq. ft. total uniform load with a minimum factor of safety of 4. Pyrofill roof and floor constructions are designed to carry any specified load by varying the size and spacing of the reinforcement and the depth of slab.

Fireproof—Gypsum is acknowledged to be one of the best fireproofing materials known. Gypsum will not support combustion or conduct heat; neither has it appreciable contraction nor expansion; consequently, it will not warp, buckle, or spall under severe fire.

Minimizes Condensation—Superior insulation is

a dominant quality in gypsum roof construction. Tests give the following units of B.t.u. transmitted per square foot per hour per degree Fahrenheit difference in temperature for various roof deck materials:

3-in. Gypsum (Pyrobar or Pyrofill).....	.25
3-in. Solid Concrete Slab 1:2:4 mix.....	.75
1-in. Cement Tile.....	.99
Corrugated Iron.....	1.50

Less heat is transmitted through gypsum than through any other structural material. On account of its low conductivity the undersurface of a Pyrobar or Pyrofill roof deck remains at practically the same temperature as the interior of the building, regardless of outside temperature. Except under saturated air conditions, no sweating or dripping will occur and condensation is eliminated.

Heat Saving—The superior insulation value shows a decided saving in heat and heating equipment as compared to a concrete slab. This means an accumulating saving in fuel cost as well as a saving in initial cost of heating plant installation.

Light Weight—Are more than 50% lighter than concrete per square foot of surface for equal thickness, which results in considerable saving in steel framing, supporting members and material throughout the building.

Adaptability—Our roof decks in both the poured-in-place and precast types are very flexible in their adaptation to any form of roof design, whether flat or pitched with simple or complicated framing, or of large or small area.

Quickly Erected—The light weight materials or units are very speedily placed. No waiting for slabs to cure or forms to be removed. Re-roofing may be accomplished with Pyrobar or Pyrofill without interference to plant operation.

Light Diffusion—The undersurface is smooth and white (except for Sheetrock Pyrofill, which is light gray) and affords excellent light reflection without painting. Is admirably adapted for painting if desired.

Permanency—Established through years of use.

Not affected by deteriorating action of fumes from sulphurous acids or by chemical action of smoke. Maintenance cost is reduced to a negligible minimum.

Special Constructions—Extreme conditions of temperature, humidity or use of chemicals often require special consideration. For best results, secure our recommendations for type or treatment of the roof deck.

Pyrobar Roof Tile, 30-in. Type

All short span roof tile are manufactured 12 in. wide and 30 in. long, in thickness either of 3-in. solid or 4-in. hollow. The 3-in. solid is recommended particularly for nailing purposes because its design assures maximum penetration and, therefore, maximum nailing power. The 4-in. hollow fills all requirements for a light weight tile of high insulation value on which a built-up roof covering is to be applied. This tile is not recommended for nailing purposes. Both types are

easily cut to fit intricate design of steep pitched roofs, or those with dormers and difficult intersections.

Short span, or 30-in. roof tile, require subpurlin supports, usually tees, or light structural shapes, such as I-beams or channels, may also be used with economy on spans from 7 ft. 6 in. to 12 ft. Where trusses or main supports do not exceed 12 ft., a notched 30-in. tile laid directly on light I-beam purlins spanning directly between steel trusses or main supports has proven economical.

This type of construction is by far the most flexible of any precast system. It can be used with economy on any type of factory or industrial building, power plant, school, etc., and, in addition, is particularly well adapted to steep pitched roofs, or roofs that are badly cut up with dormers, hips, valleys and difficult intersections.

Curb or wall for monitors and sawtooth sash are built of 3-in. solid Pyrobar curb tile. End walls of monitors and sawtooth are similarly built, the roof covering being extended to cover curb and end walls.

Pyrofill drainage system may be used when drainage fill is required.

A Typical 30-in. Pyrobar Roof Under Ornamental Tile, Masonic Home, Bloomington, Minn.

Insulating Tile

Pyrobar insulating tile are 3x12x30 in. solid, of a specially prepared gypsum mixture non-reinforced, weighing 10 lb. per sq. ft. Extremely low coefficient of conductivity, will be found particularly well suited to the correction of faulty roof insulation, of power plants, turbine rooms, wet process plants, etc.

Old roofs of concrete, cement tile, etc., may be successfully insulated with this special tile without interruption of manufacturing processes.

Construction Details Showing Typical Designs of Pyrobar Roof Tile

Pyrobar Long Span Hollow Roof Tile

This type of tile meets the demand for a precast roof unit which eliminates the use of T-iron subpurlins. It is manufactured in 4-ft. to 6 ft. 6-in. lengths and the tile are laid directly on the steel framing. The tile are furnished either with or without a lap joint depending on the bearing afforded. Lap joint tile should be used whenever channel purlins are used. Long span hollow tile weigh 20 lb. per sq. ft. for the 5-in. depth and 25 lb. per sq. ft. for the 6-in. depth. Where plant conditions are severe or maximum insulation is desired, the 6-in. depth of tile is to be preferred.

Specifications for Pyrobar Roof Tile

Short Span 30-in. Type Roofs—All roofs as shown on drawings, unless otherwise noted, shall be constructed of Pyrobar (state type of tile, whether 3-in. solid or 4-in. hollow) Roof Tile, as manufactured and erected by the UNITED STATES GYPSUM COMPANY, laid on subpurlins of size and spacing as indicated on drawings.

Note: Where it is desired to nail composition or shingle roofing, copper or tin sheathing, or other light roof covering directly to the Pyrobar roof deck, we recommend 3-in. solid Pyrobar and a square cut nail having not less than 1½-in. penetration into the tile. For rough slate, Spanish tile, etc., a square cut nail having not less than 2-in. penetration into the tile is recommended.

Nailing strips or bolting through the slab should be used on roofs of extreme pitch, or where special extra heavy slate or tile roofing is used.

Erection—Tile to be placed directly on supports without mortar and with sides tight together, bearing at each end upon subpurlins to be not less than ¼ in. All joints on top surface only of roof are to be pointed with gypsum mortar composed of 1 part of unfibred gypsum cement plaster and not more than 2 parts of clean, sharp sand. All steel work to be furnished and erected by the steel contractor.

Notes: When desired, the UNITED STATES GYPSUM COMPANY will contract for the furnishing and erecting of the necessary T-iron or rail subpurlins.

Specifications for curbs, end walls, completion and covering, same as for Long Span Roof Tile.

Long Span Hollow Type Roofs—All roofs as shown on drawings, unless otherwise noted, shall be constructed of Pyrobar (state type and size) Long Span Hollow Roof Tile as manufactured and erected by the UNITED STATES GYPSUM COMPANY.

Erection—Tile are to be placed directly on roof supports without mortar and with sides tight together bearing at each end upon purlins to be not less than 1¼ in. All purlins to be drawn into true alignment with sag rods by the structural steel contractor before any tile are placed. All joints on top surface only of roof are to be pointed with gypsum mortar composed of 1 part unfibred gypsum cement plaster and not more than 2 parts of clean, sharp sand.

Curbs—Curbs under monitor and sawtooth sash shall be constructed of 3-in. solid Pyrobar Curb Tile (or gutter tile), set in gypsum cement mortar, joints to be well bedded and struck.

End Walls—All end walls of monitors, A-frames, etc., shall be constructed of 3-in. solid Pyrobar Curb Tile. Steel contractor to provide sufficient steel framing to allow for proper anchoring of wall.

Completion and Covering—All Pyrobar Roof Decks to be left with as smooth a finish as practical to receive the roofing contractor's covering, which shall be applied within 20 days after completion of the roof deck.

Sheetrock-Pyrofill Roof Construction

Sheetrock-Pyrofill construction consists of a reinforced gypsum slab poured on permanent Sheetrock forms. ⅜-in. Sheetrock, in lengths equal to the purlin spacing, is supported on the bottom flanges of light rail or T-iron subpurlins, which are spaced 32½ in. on center and clipped to the roof purlins. A gypsum slab of required thickness, reinforced with electrically welded steel fabric, is poured directly on the Sheetrock. All joints being concealed by the purlins, the underside of this roof has more the appearance of a finished ceiling than a roof deck. This system eliminates the end bay bracing required for the poured suspension system, and the Sheetrock undersurface is dustproof and can be painted readily if desired.

Sheetrock-Pyrofill construction can be economically used on practically any sized structure and is better adapted to small variations in purlin spacing than any other type of gypsum roof deck. By increasing the size of the rail subpurlins, spans to 12 ft. 6 in. or even greater may be accommodated, spanning directly between trusses if desired. For ordinary framing conditions, however, a span of 8 to 10 ft. will be found the most economical.

Sheetrock-Pyrofill construction particularly well adapts itself to the decking of auditoriums, garages, theaters, gymnasiums, power plants, industrial plants—in fact, any steel framed building where a light weight, highly insulative roof deck with a finished ceiling effect is desired.

Specifications for Sheetrock-Pyrofill Roof Decks

Unless otherwise shown or noted, all roof slabs shall be of the thickness shown on plans and shall be constructed according to the UNITED STATES GYPSUM COMPANY'S system of Sheetrock-Pyrofill Construction. This contractor shall provide all Sheetrock, subpurlins, reinforcing material, Pyrofill and all

Continued on next page

CONSTRUCTION DETAILS SHOWING TYPICAL DESIGNS OF SHEETROCK-PYROFILL ROOF CONSTRUCTION

Smooth Undersurface of Sheetrock-Pyrofill Roof Construction, Hall Printing Co., Chicago, Ill.

labor required for his work. Light rails or T-iron subpurlins shall be laid and fastened to the main purlins by clips. The subpurlins shall be so spaced as to accommodate the size of Sheetrock used. The Sheetrock shall be laid on and supported by the bottom flange of the subpurlins and on the boards shall be laid an electrically welded galvanized steel reinforcing mat of the proper sectional area to carry the specified roof load. The main reinforcing wire of this mat shall run at right angles to the subpurlins.

The Pyrofill composition used shall consist of a uniform mixture of calcined gypsum and water into which is stirred not over 12% by weight (12 lb. by weight) of wood planer shavings to every 100 lb. of calcined gypsum and shall be poured directly on the Sheetrock to the required thickness and screeded to as smooth a surface as practicable. The roofing contractor shall lay thereon the waterproof roofing covering.

All openings in slabs for down-spouts, soil pipes, vents, etc., shall be accurately located by the purchaser before the slab is poured. All curb walls, and ends of monitors, etc., shall be constructed of 3-in. Solid Pyrobar Curb Tile, neatly laid up in gypsum mortar.

The waterproof roofing covering shall be applied as soon as possible after the slab is erected, preferably within 20 days.

Pyrofill Monolithic Roofs and Floors

This type of construction is the suspension type of gypsum construction wherein the loads are carried by steel wire cables. These cables are anchored at both ends to the steel framing and are brought into tension in the center of each span between the purlins by means of rods nailed to the wood forming. The gypsum composition acts mainly as a filler to transmit the load to the "catenary" thus formed. The spacing of the cables varies from 1 to 3 in. and the depth of slab from 3 to 5 in. to meet the requirements of load and span. 3 in. for roofs and 4 in. for floors are the generally used depths of slab and the most economical spacing of supporting purlins is from 5 to 7 ft. on centers. The weight of the slab is 4 lb. per sq. ft. per inch of thickness—i.e., a 3-in. slab weighs 12 lb. per sq. ft.

Wood forming is used for the slabs and, if desired, forms may also be built around the supporting beams and girders to give monolithic fireproofing of the steel with the gypsum composition. (See also Pyrobar Beam and Girder Fireproofing on page A383.) Forms are built of dressed and matched lumber and, due to the light weight of gypsum, do not require the extensive shoring needed

Pyrofill Monolithic Floor Construction Forms in Place and After Stripping

for concrete forms but are hung and braced from the steel framing.

The suspension type of gypsum floor and roof construction has been in use for over 30 years under various names. With the supporting steel encased in gypsum, this construction enjoys the highest insurance rating and is recommended for buildings with combustible content where insurance rates will be a factor.

The Pyrofill monolithic system best adapts itself to floor slabs of multistory steel framed office, hotel and similar buildings and to the roof decks of large industrial plants.

Specifications for Pyrofill Monolithic Roofs and Floors

Unless otherwise shown, all slabs shall be constructed of Poured Gypsum in accordance with the system of the UNITED STATES GYPSUM COMPANY known as Pyrofill Monolithic Slab Construction. This contractor shall provide necessary forms, reinforcing cables, Pyrofill and all labor required for his work.

Forms—The forms shall be made in workmanlike manner,

of suitable material, and shall be carefully leveled up so as to insure a uniform depth of slab. Forms shall be cleaned before each re-use. All openings in slabs for down-spouts, soil pipes, vents, etc., shall be located by purchaser before the slab is poured, as no cutting of cables will be permitted after slabs are poured.

Reinforcing—Reinforcing shall consist of galvanized steel cables made by twisting two No. 12 wires. These cables shall be calculated to take the entire slab load and shall be fastened at their ends in such manner as to develop the full strength required. In no case shall the stress in the cables exceed 20,000 lb. per sq. in. The spacing of these cables and the depth of slabs shall conform to the standards of the UNITED STATES GYPSUM COMPANY. The cables shall be drawn tight and fastened to suitable anchors and brought to uniform tension. Care shall be used in placing the tension rods to see that the cables shall not be brought closer than $\frac{1}{2}$ in. to the undersurface of the slab. After cables are in place all workmen of this and other contractors shall be prohibited from walking thereon.

Composition—The Pyrofill composition used shall consist of a uniform mixture of calcined gypsum and water, into which is stirred, not over 15 lb. by weight, wood planer shavings to every 100 lb. of calcined gypsum. The top surface of the slab shall be screeded to as smooth a surface as possible to receive the waterproof covering.

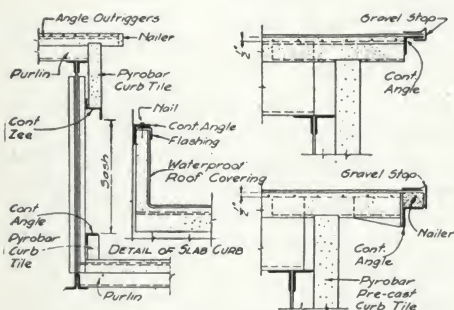

If the underside of the slab is to be plastered or painted, such work shall not be done until the waterproof covering has been applied and the slab is thoroughly dry.

Curbs, etc.—All curb walls, ends of monitors, etc., shall be constructed of 3-in. Solid Pyrobar Curb Tile, neatly laid up in gypsum mortar, or of poured construction similar to the roof slabs.

Openings—The steel contractor shall provide steel framing around all openings more than 12 in. in diameter, and such steel bracing as is required to take the horizontal pull of cables where anchored, such as at end bays of buildings and all openings.

Covering—The waterproof covering shall be applied preferably within 20 days after completion of roof slab. Plank runways shall be laid on the slab before any wheeling whatever is done. Plank supports shall be laid from purlin to purlin to take any heavy or concentrated loads which may be applied to the slab.

Insert in Steel Specifications—Steel contractor shall submit drawings to the UNITED STATES GYPSUM COMPANY for checking, to insure that all details are properly taken care of.

STEELDECK ROOFS.

For Concrete Reinforcement, see pages A134-135; for Steel Joists, see page A578; for Steel Windows and Doors, see pages A1082-1085; for Metal Lath, etc., see pages B1306-1307.

They have prongs that are bent around the supporting members (usually purlins), and hold the I-Plates securely.

Advantages of I-Plates Construction

- (1) *Light weight*—not over 5 lbs. per square foot including insulation and waterproofing.
- (2) *Incombustible*—fabricated complete from copper-alloy steel.
- (3) *Expansion and contraction difficulties eliminated*. Expansion joints are provided in two directions at the sides and ends of each I-Plate. There can be no accumulation of appreciable movement.
- Insulation and waterproofing is positively free from injury by this usual source of trouble.
- (4) *Any degree of proper insulation* may be easily obtained.
- (5) *Saves time* in completion of buildings, especially in wet and winter seasons.
- (6) *Low final cost*—light weight effects savings in structural supports.
- (7) *Engineeringly correct*—spans to 8 ft. between supports, depending upon the loading requirements.
- (8) *Permanent*—made of copper-bearing steel. Protected from above and below.
- (9) *Adaptability*—best for straightaway, flat, pitched and curved roofs with a minimum radius of 40 ft.
- (10) *Undivided responsibility*. Roofers will furnish roofs complete—deck, insulation and waterproofing.

The Importance of the Right Roof

When choosing a roof design, occupancy conditions, heating, ventilation, humidity—both exterior and interior—and geographic location must be considered. The right roof must be practicable in design and purpose. The right roof must successfully protect against the elements of wind, water and fire. It must be flexible, firm and free from inherent movement caused by expansion and contraction. It must be economical. It must harmonize in its details with the structural supports.

Steeldeck Roofs of Truscon I-Plates are of a broad and general usefulness. They meet all requirements and conditions, and are particularly adaptable to theatres, gymnasiums, auditoriums, public halls and many industrial buildings requiring large floor areas free from supports and obstructions.

Truscon I-Plates Design

The I-Plates type of Steeldeck is a roof deck so formed that each plate is a unit capable of carrying the specified loads between the members of the roof structure.

I-Plates are manufactured from Nos. 18 and 20 gauge copper-bearing steel with I-Sections formed on the bottom side longitudinally. On one edge a complete I-Section is formed, on the other edge a turned down flange of about 1/2 in. is provided, to fit into the edge I-Sections of adjacent I-Plates when laying the Steeldeck. At one end the I-Sections of the I-Plates are flush with the top surface, at the other end the I-Sections are cut back about 3/4 in. so that when laid, the end joints are lapped tight.

I-Plates are applied directly over the members of the roof supporting structure and are fastened by sleeve "purlin clips" that telescope over alternate I-Sections.

Descriptive Data

Standard width of I-Plates: 2 ft.

Length of I-Plates: standard, 10 and 8 ft.; special as required, 10 ft. maximum.

Dimensions of I-Sections: spaced, 6-in. centers; depth, 1 in.; bottom flange width, 5/8 in.

The dead load of I-Plates Steeldeck Roof and insulation and waterproofing is approximately 5 lb. per sq. ft.

LIVE LOADS AND SPANS

Product

Holorib, a permanent copper-bearing steel roof deck self-reinforced by hollow triangular ribs with apex nearly closed, each rib a complete girder beam. Built in sheets of various lengths of 26, 24, 22, and 20 gauge copper-bearing steel dip painted and oven baked after fabrication. Lead treated or galvanized sheets are formed also. The upper surface of the deck is unbroken and continuous, and is thereby especially adapted to the application of insulation and waterproofing. [Holorib is also used in concrete floor systems by inverting the sheet and permitting the ribs to act as reinforcing members. It is capable of supporting normal loads over wide spans, and in many instances, wood forms may be eliminated. Special descriptive data on request.]

The outstanding advantage of Holorib insulated construction over many others is that the decking, insulation and the roofing are cemented together, forming an airtight blanket; there are no cracks to permit leakage of air.

Plank decks after drying and decks of various other materials are reduced in efficiency by leakage of air through cracks. Unprotected metal decks have practically no heat insulating value, and are not permanent.

Dry insulation is a perfect base for the application of waterproofing—Complete and permanent adhesion invariably results, and by eliminating condensation there can be no rust or corrosion.

Holorib Principle

The Holorib Insulated Roof brings a comparatively new but thoroughly tested principle to the industry. The complete unit consists of the following three component parts:

(1) A steel supporting member of Holorib construction fabricated by an exclusively controlled process. A permanent light weight roof deck reinforced by closed triangular ribs, each rib a complete girder beam.

(2) This fire resistive supporting member is insulated with any standard pressure-resisting insulating material meeting Government conductivity tests, the thickness of the insulation varying with the particular conditions to be met.

(3) Over the insulated steel supporting member is applied built-up waterproofing such as asphalt, asbestos, slag or gravel surface construction.

Advantages

The Holorib Insulated Roof is highly fire resistive from below and also from above when waterproofed with proper materials.

The Holorib Insulated Roof is one of the lightest permanent decks in existence, thus allowing for minimum weights of structural members.

The shape of the rib allows for ample expansion and contraction so that all danger from cracks in the waterproofing is eliminated.

The Holorib Insulated Roof provides a perfect base for the application of insulation, thus performing, apart from its waterproofing value, a definite yearly saving in the amount of fuel which is consumed, and providing for a reduction in the amount of radiation required.

The Holorib Insulated Roof can be applied with safety at any season of the year, and on any day when it is not actually snowing or raining.

Holorib Insulated Roofs are reasonable in price and, when the savings in structural steel are taken into consideration, may frequently be installed at a lower initial cost.

With the Holorib Insulated Roof, condensation is entirely eliminated, and with a field coat of paint on the ceiling, there is no opportunity for rust or corrosion since the steel deck itself is subject only to the same atmospheric conditions as affect filing cabinets, steel desks, etc., within the building.

Thermal Conductivity of Holorib

The following table gives the thermal conductivity of Holorib roofs, including in each case a standard composition roofing.

Roof Construction	B.t.u.
(1) Holorib without insulation	0.96
(2) Holorib and ½-in. insulation	0.39
(3) Holorib and 1-in. insulation	0.23 to 0.25
(4) Holorib and 1½-in. insulation	0.18
(5) Holorib and 2-in. insulation	0.14

Insulation referred to above may consist of such pressure resisting materials as Cork, Celotex, etc. The values of the thermal conductivity are in terms of B.t.u. (British thermal units) per square foot per hour, per degree difference between inside and outside temperature. They are computed from data published by the American Society of Refrigerating Engineers, in "Heat Transmission of Insulating Materials."

Specification for the Holorib Roof Unit

Material—(1) Holorib Sheets—The Holorib sheets shall be manufactured with crimped or tapered ends to form interlocking and telescoping shingle laps, and turned flange to form a side lap, from 26, 24, 22, or 20-gauge copper-bearing steel, by HOLORIB INCORPORATED. The material shall be rolled at the factory and all sheets shall be given one shop coat of good quality paint.

(2) Insulation—The insulation shall be of the pressure resisting type, approximately 1 in. thick and, preferably, of ½-in. sheets with broken joint

24-Gauge Holorib Steel Sheet

Standard lengths up to 10 ft. 3 in.

construction. It shall have conductivity of not to exceed 8 B.t.u.'s per 24 hours, per degree difference in temperature per square foot, by the flat plate method.

For those situations which are not unusual the following may be used with reasonable assurance that no condensation will occur.

For buildings having only normal atmospheric moisture, one or two layers of ½-in. or one layer of 1-in. approved insulation on Holorib.

For buildings in which there is a moderate amount of steam leakage, such as powerhouses, or evaporation from open tanks at atmospheric temperature, three layers of ½-in. or one layer of 1½-in. approved insulation on Holorib.

For buildings in which are conducted manufacturing processes liberating considerable quantities of steam, but where occasional condensation on the underside of the roof in extreme conditions will not cause serious harm, four layers of ½-in. or two layers of 1-in. approved insulation on Holorib.

For conditions more severe than the one just mentioned, the case should be worked out by a heating and ventilating engineer as above recommended.

(3) Cementing Agent—(A) On roof surfaces having a pitch less than 3 in. in 12 in. the insulation shall be mopped to the Holorib Deck and to itself with hot asphalt equal to U. S. Government Master Specification No. 88.

(B) On roof surfaces having a pitch exceeding 3 in. in 12 in., if asphalt is to be used as the cementing agent, it shall first be mechanically stiffened by the addition of 10 lb. of short asbestos fibre to each 100 lb. of asphalt to avoid slipping or creeping.

(C) On roof surfaces having a pitch exceeding 3 in. in 12 in. silicate of soda, equal to S-4 grade, as manufactured by the Grasselli Chemical Co., Cleveland, Ohio, may be used to cement insulation to the Holorib Deck.

(4) Waterproofing—Shall be of the built-up bituminous type for flat or pitched roofs. On steep pitched roofs, slate, tile or asbestos shingles may be installed.

(A) The built-up bituminous waterproofing material and workmanship shall be first class in every respect, the surface

finish to be either asphalt, slag, gravel or asbestos. Where a built-up asphalt waterproofing is used not less than four plies of all rag felt, equal to U. S. Government Standard Specification No. 86, shall be required.

(B) Where slate, tile or asbestos shingles are used the insulation shall be securely bolted to the Holorib using six bolts to each 18 sq. ft. in addition to being cemented with either mechanically stiffened asphalt, as above described, or silicate of soda. After the insulation is applied, not less than 1 in. thick, a 30-lb. waterproofing felt shall be cemented on with hot asphalt, after which the tile or slate is to be applied, nailing directly into the waterproofing and insulation; or nailed to wood furring strips securely bolted to the insulation and roof deck.

Note: Frequently architects favor Holorib but do not desire to specify it by name. Their specification may be written as follows: "Twenty-four (or twenty-two) gauge copper-bearing steel sheets with self-contained, closed triangular ribs forming a substantially continuous mopping surface with telescoping or interlocking shingled end laps and locking side laps."

Application—(1) The Holorib shall be tightly secured to the purlins by specially designed Holorib clips (or nailed to wood joists). Application shall start as indicated on the Holorib layout which is furnished by their Engineering Department. All sheets shall be properly lapped at both sides and ends in accordance with standard practice of HOLORIB INCORPORATED, as shown on its detailed drawings.

(2) The application of the insulating material shall proceed immediately following the placing of the Holorib. Due care must be exercised in protecting the roof deck from heavy construction loads such as wheelbarrows, ladders, etc. Each sheet shall be embedded solidly in a mopping of asphalt. If two plies of insulation are used it shall be applied in broken-joint construction.

(3) In case the roof deck has a pitch exceeding 3 in. in 12 in., the first ply of insulating material must be secured to the Holorib deck either with two bolts to each sheet of insulation, bolted through the steel deck itself, or by means of clips specially fabricated for this purpose by HOLORIB INCORPORATED. The asphalt shall be mechanically stiffened to avoid creeping and slipping.

(4) After the insulating material is in place the surface shall be waterproofed as previously described and according to specifications of the manufacturer whose materials are used.

(5) Flashings and edgings may be put in as shown in Holorib detailed drawings. All gutters, in sawtooth construction, shall be reinforced with at least one extra ply of felt carried to the waterline.

(6) Any saddles necessary to properly carry water to outlets are to be formed with a material satisfactory for this purpose. The saddles to be formed after the insulating material is in place, but prior to application of roofing. The insulating material under saddle area to be waterproofed with one ply of felt or one heavy mopping of asphalt.

Channel or Angle

I-Beam, Gabriel Joist or Junior Beam

Massillon Bar Joist

Metal Lumber

24-Gauge Standard Holorib Clips

Note: We stock clips for all well-known light weight joists

"Wide-Span" Holorib Clips

"WIDE-SPAN" Holorib clips are designed to clamp rigidly to standard structural shapes and are used only in connection with Holorib 22 or 20-gauge steel deck. They do not pierce the steel deck itself.

Over light weight joists special clips are furnished for 24-gauge Holorib, piercing the sheets and forming a riveted connection.

Special clips to be used in connection with 26-gauge Holorib, when inverted and used as a concrete form support, are de-

signed to clamp tightly to standard structural shapes and joists.

Holorib decks have been tested for *reverse* loads and will support 100 lb. per sq. foot—double the requirements for cyclone and hurricane insurance.

Sizes of Sheets and Quantities for Holorib Roof Decks

Holorib sheets are furnished in the following stock lengths:

4 ft. 3 in.	8 ft. 3 in.
5 ft. 3 in.	9 ft. 3 in.
6 ft. 3 in.	10 ft. 3 in.
7 ft. 3 in.	

Any lengths up to 12 ft. 3 in. can be furnished for special orders, provided definite lengths are ordered in ample time to permit securing the special length sheets from the rolling mills.

Standard widths measured in place are 16½ in. on 26 and 24 gauge, and 18 in. on 22 and 20 gauge. These widths cannot be varied, but the odd widths required for making up a fixed dimension of roof can be made by splitting standard sheets.

The recommended practice is to allow a minimum of 2 in. end lap. For ordering give the number of sheets of each length required, or send dimensioned plan showing area to be covered, the spacing of purlins, and bearing allowed on parapet walls. Shipping weights of materials are as follows:

26 gauge—	135 lb. per square
24 gauge—	170 lb. per square
22 gauge—	230 lb. per square
20 gauge—	280 lb. per square

Minimum carload 36,000 pounds. Freight classification, "Iron and Steel Roofing—N.O.I.B.N."

Load Carrying Capacities

Load carrying capacities of Holorib are as follows:

Gauge		Purlin spacing ft. in.	Total load per sq. ft.	Factor of safety
24	Holorib	4 0 4 6	60	4
22	Wide-span	4 6 5 6	60	4
22	Wide-span	5 6 6 3	50	4
22	Wide-span	6 3 7 0	40	4
20	Wide-span	7 0 8 0	45	3

The Holorib steel sheet has several inherent advantages over any other type of steel deck:

(1) The hollow triangular rib is the strongest shape used in building construction.

(2) The rigidity and load carrying capacity of the Holorib steel roof deck on purlin spacings up to 8' is superior to other competing decks, and its stiffness imparts a decided feeling of security.

(3) The unbroken and continuous upper surface of the Holorib deck offers a solid mopping on which to lay insulation.

(4) In the Holorib triangular rib construction the ribs are *fully* painted on all surfaces. No metal is left bare.

(5) The crimped or tapered ends of the ribs lock tightly into those of the adjacent sheets, thus doing away with the necessity of any sleeves or other fastenings at this point, and due to this method, a rigid continuous construction is maintained whether on or off purlins.

(6) There is absolutely no chance for asphalt or pitch drippage.

(7) The underside of the Holorib deck presents an unbroken and symmetrical ceiling of metal.

(8) In case of fire, fluid asphalt will run down to the eaves of the building unobstructed.

(9) Holorib carries the same insurance rating as cement tile, concrete or metal lath or gypsum, over unprotected steel with or without suspended ceilings.

24-Gauge Holorib Interlocking Features

Detail shows Holorib interlocking features, side and end and to purlins. Advantages—strength, continuous flat mopping surface for asphalt, etc.

PAN METAL ROOF DECK CO.

AKRON, OHIO

Product

PAN METAL ROOF DECK.

Description

The Pan Metal Roof Deck is an improved metal form designed especially for roof construction, which has earned the approval of architects, engineers and builders everywhere.

It consists of pressed metal units as illustrated in the sectional details herein shown, and has no sharp folded members to take on rust. Consulting engineers agree with us, when we claim that no stronger sheet of light metal can be formed that will carry an equal load.

It provides long life, strength and perfect fitting joints. The sheets are formed under a powerful press, insuring uniform pans that will rest neatly, and they are made to lay 24-in. centers up to 12 ft. 2 in. long.

Insulation made in 12, 24, 36 or 48-in. widths will center on the wood cleats in pans. These cleats are placed in position and fastened at the factory. All sheets are laid from above and no underneath scaffold is required.

Galvanized sheets cost slightly more than painted (black) steel sheets but are more enduring. Sheets can be painted with acidproof asphalt paint for foundries and factories where gas accumulates.

Safe load without deflection at 50 lb. per sq. ft., while 2x4 ft., 8-sq. ft. test shows 75 lb. per sq. ft.

Layout plans will be furnished by us from blue prints, insuring proper spacing.

Factory Sawtooth Construction

For factory sawtooth construction, the heavy steel frame can be eliminated and light metal joists with the pan deck substituted at greatly reduced cost.

Sheet Metal Building

There are tens of thousands of sheet iron buildings in use in the United States that are not insulated, because of the difficulty of connecting the insulation to the sheets. Without this insulation they are cold in winter and extremely hot in summer.

With the Pan Metal Deck and its method of wood cleat anchorage, any form of insulation can be nailed securely to the metal sheets. The sleepers provide air circulation through the slots at every purlin, as illus-

Construction Details Showing Shape of the Pan Deck and the Location of Wood Cleat, etc.

Pan Metal Roof Deck Used on a Sheet Metal Building Showing the Application of Insulation and Roofing Material

trated. These are made of wood that will not split, thoroughly painted with linseed oil paint and they will stay in position.

The seams or joints in this construction are made directly over the purlins, thereby making a neat appearance when a finish underneath is desired.

Advise us of your requirements or your problems, and we will immediately give you all necessary information to enable you to erect a substantial structure at the least expense and trouble. Blue prints, etc., gladly supplied for all requirements.

For Residences

The Pan Metal Deck can be used on residences for pitched roofs when slate, tile or other roofing material is desired, rendering this construction fireproof inside and out.

The rafters are first placed in position and securely nailed. Upon them the purlins are laid and fastened; over these are secured the Pan Metal Deck forms as illustrated. These in turn are covered with insulation, and with roofing material—shingles, tile, or whatever the architect specifies. If built-up roofing is used, it is applied directly to insulating surface. Where asphalt shingles or strip shingles are used, they may be nailed directly to insulation.

Note that the slot at the purlins is locked in $\frac{1}{4}$ in. wide by $\frac{3}{4}$ in. long. The lug is made of $\frac{1}{8}$ in. thick zinc and will not rust. It is so tough that it can be doubled and hammered together without breaking. The slot being $\frac{1}{8}$ in. wider than the lug permits the metal to expand and contract.

Flashing at vertical walls can be securely nailed by placing an extra wood sleeper there.

If necessary to install gutters, a horizontal wood strip $\frac{7}{8}$ x20 in. can be nailed to ends of sleepers at the eaves.

The erection of the METROPOLITAN SYSTEM of GYPSUM FIREPROOF FLOOR and ROOF CONSTRUCTION.

Metropolitan System of Gypsum Fireproof Floor and Roof Construction

The principle of this system is that of the suspension bridge. It is a gypsum slab poured in place on parallel and uniformly spaced cables, the ends of the cables securely and rigidly anchored to the frame of the building. Enough cables are put in to carry the total load, with a factor of safety of 4, without regard to the compression value of the Metropolitan composition.

The composition is 87½% calcined gypsum, and 12½% wood planer chips.

The practical advantages of the system have been demonstrated over a period of thirty-five years in hundreds of installations throughout the United States and Canada, under a wide extreme of climatic conditions.

Meritorious Features of the Metropolitan System

Safety and Strength—The metal construction makes the Metropolitan system one of the safest types of roof and floor construction. Stresses are calculated by approved engineering formulae. The cables carry all the load. The Metropolitan composition is used merely to protect the wires and structural framework against fire and corrosion and to distribute the load.

Economy of First Cost Due to Light Weight and Rapidity of Construction

Metropolitan composition weighs less than 5 lb. per sq. ft. per inch of thickness. For floors, minimum thickness is 4 in.; for roofs, 3 in. The light weight permits lighter beams and wide spacing, thus saving tons of steel. This feature makes it particularly advantageous in additional story work. In existing structures, this extreme lightness permits the replacing of less sturdy floors with-

out either strengthening existing frames or overloading them.

The fact that Metropolitan gypsum composition sets within 30 minutes after the slab is poured, and forms can be dropped within 60 minutes, leaving slab good for calculated loads, makes for rapid construction—a prime factor in construction economy. The Swarthmore Apartments in Philadelphia, Pa., stand as a monument to the speed with which the system may be installed. This job was put up, 12 floors and roof, in fourteen working days.

Non-conductivity, Insulation and Fire Resistance—The high insulating value of Metropolitan gypsum composition as a roof material effects a saving in cost of the heating plant. Condensation of moisture on the undersurface is eliminated.

It is a fire resistant of the highest quality. Complete reports of fire tests conducted for the New York and Toronto building bureaus gladly furnished.

Sound Deadener—Gypsum has excellent sound deadening properties. In the Metropolitan composition full advantage is taken of this characteristic.

Durability—Metropolitan floors and roofs have been in active service, under severe conditions, for over thirty-five years and are today, without exception, in as good a condition as when installed. Frequently sections have been cut out of Metropolitan floors which have been installed for many years and, in every case, the embedded beams and girders, as well as the steel cables, have been found in perfect condition.

Low Maintenance—Elasticity is necessary to good roof and floor construction. Shocks, vibrations and unequal stresses are likely to crack an inelastic construction. The wood filler in the Metropolitan composition provides elasticity and Metropolitan roofs and floors remain intact under the severest conditions, thus eliminating the annoyance and expense of constant repairs.

Service—This company contracts for the entire installation of both floor and roof arches. They regard each contract as a sale of service in addition to the sale of material and workmanship. Nor is the delivery of service completed with acceptance of the contract. It is a service, in other words, which is rendered not only *during* the work but *before* and *after* its execution.

Guaranteed Construction—The KEYSTONE GYPSUM FIREPROOFING CORPORATION guarantees every square foot of floor or roof construction they install against failure from any cause, under the conditions for which it was designed.

Where the Metropolitan System Is Used

The Metropolitan system is being used with utmost satisfaction mainly in hotels, clubs, schools, hospitals, churches, apartment houses, theaters, office buildings, etc. Fully 72% of the orders booked yearly have been repeat orders.

Colton Manor Hotel, Atlantic City,
N. J.

Twelve Metropolitan floors and roof

Information for Designing

Services of Engineering Department—Our Engineering Department should be consulted before steel design of building is completed. We will gladly send our engineers to confer with you without expense or obligation.

Economical Spans—The construction can be installed between supports spaced up to 9 ft. in clear. Our experience has shown that under average conditions a spacing of 6 ft. 6 in. to 7 ft. is the most economical.

Waterproof Roofing—Any standard type of waterproof roofing may be successfully applied to our metropolitan system. The form most generally applied, however, is a 3-ply built-up roofing.

Specifications

Fireproof Floors and Roofs—After forms or centers have been placed in proper position, cables, each composed of two No. 12 (or equivalent) galvanized wires twisted, shall be carried over the tops of the beams or purlins to outside wall beams or end purlins and be secured to them by strong hooks or anchors. These cables shall be laid parallel, 1 to 3 in. apart, according to spans and loads, and shall pass under round iron bars, midway between the purlins, so as to cause the cables to deflect uniformly. The Metropolitan composition shall then be poured-in-place, and brought to an even surface about $\frac{1}{2}$ in. above the top of the beams, forming a slab ready to receive [sleeper fill or grading] [finished roofing or grading] and with the underside left as smooth as practicable. The slab shall be designed to carry safely the live load with a factor of safety of 4.

Note: For fireproof floors, fireproofing beams and girders (not trusses) shall be used, according to the local building laws.

Cables composed of 2-No.12 Cold Drawn Galvanized Steel Wires Twisted
Cable = 2 x .00874 @ 20000#* = 3.50#
W = .1152 in.

MONOLITHIC GYPSUM FLOOR and ROOF CONSTRUCTION:

Standard Suspension Type.

Hoge Rail Type (U. S. Pat.—1464711, Can. Pat.—241477).

Enclosed Rail Type (U. S. Pat. Pending, Can. Pat.—254632).

Preformed Rail Type Floor and Roof Slabs (Patent Pending).

Construction Service

This company, backed by 13 years' experience in gypsum construction, is at your service for advice and estimates for the above types of construction installed complete in any part of North America.

Rail Type of Monolithic Gypsum Floor and Roof Construction

The Standard Suspension type of gypsum slab construction was the only type of poured-in-place or monolithic roof and floor slab construction extensively used until the rail types were originated and developed by this company a few years ago.

Specifications and list of representative installations of the Standard Suspension type of construction sent on request.

While this company is prepared to install the Suspension type where specified or on rare occasions where it fits special conditions, the approval of architects, engineers, and owners throughout the United States and Canada is convincing proof that the Hoge and the Enclosed Rail Types are best suited to the great majority of conditions, and conform more readily to the standards of design and appearance required by architects.

Hoge Rail Type—In the Hoge Type small A.S.C.E. rail sections are laid about 32 in. apart on the top of walls, beams or purlins spanning the distance between beam or wall supports). On the lower flanges of the rails are supported $\frac{3}{8}$ in. standard gypsum board, Celotex or Insulite composition board, with joints over purlins to form a solid under surface, paneled by the lower flanges of the rails. The rails are designed to carry all loads, which are transferred to them by continuous mesh reinforcement running across and resting on top of the rails. Standard gypsum composition is poured in place over the gypsum board, Celotex or Insulite, and finished smooth $\frac{1}{2}$ -in. or more above the tops of the rails, ready to receive the roof or floor finish. The under surface can be decorated as desired or a finished plaster ceiling can be applied.

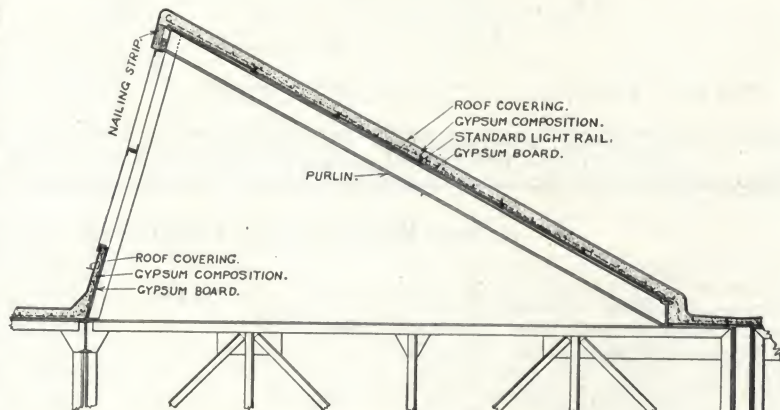

Hoge Type of Monolithic Gypsum Floor and Roof Construction

Specifications Hoge Type Monolithic Gypsum Construction—The floors and roofs named herein shall be the Hoge Type Monolithic Gypsum Board and Rail Construction as furnished by the LATHROP-HOGE GYPSUM CONSTRUCTION CO., Cincinnati, Ohio.

A.S.C.E. rail sections designed to carry all loads between supports shall be laid on the top of walls, beams, or roof purlins at sufficient spacing to receive $\frac{3}{8}$ -in. standard gypsum board carried on the lower flanges; gypsum board shall be butted tightly to form an even undersurface and braced in place if necessary to prevent buckling; galvanized mesh reinforcement of a minimum area per foot of the slab cross section of .026 in. shall be stretched over the tops of rails and allowed to sag to the top of gypsum board, forming a continuous reinforcement.

Typical Sawtooth Construction

Standard gypsum composition containing at least 85% calcined gypsum shall be mixed with water to a medium quaking consistency and poured into place, forming a solid reinforced slab $2\frac{1}{2}$ in. thick, including the gypsum board. The top surface of slab shall be left ready to receive the finish desired, such as fill, grading or waterproofing.

Overhangs in direction of span of rails shall be formed by extending same to required distance beyond the last purlin. Other overhangs shall be reinforced on the cantilever principle with reinforcement embedded in the adjacent main slab and secured to the steel of the same.

Curbs, walls, mullions, etc., shall be constructed with gypsum board facing and gypsum composition poured or plastered to regular thickness on the outer surface; or such curbs, walls, mullions, etc., may be constructed of precast gypsum blocks, all joints to be struck and outer surfaces on roofs left ready for waterproofing or other finish.

Typical Installations Hoge Type—

John Van Realty Co., Cincinnati, Ohio, 130,000 sq. ft.
Cinchfield Railroad Co., Erwin, Tenn., 93,000 sq. ft.
Pullman Car Co., Pullman, Ill., 300,000 sq. ft.
University of Illinois, Urbana, Ill., 85,000 sq. ft.
Bessemer Gas Engine Co., Grove City, Pa., 44,000 sq. ft.
Fraser Co., Ltd., Madawaska, Me., 107,000 sq. ft.
White Motor Co., San Francisco, Calif., 35,000 sq. ft.

Installations of the Hoge type may be found in practically every section of the United States.

Enclosed Rail Type—Where fireproofing or greater insulation value is desired, wooden forms are hung so as to cover the bottom of the rails with $\frac{3}{4}$ in. of gypsum composition, leaving a solid, even paneled gypsum under surface as in our Standard Suspension type slab.

Typical Installations Enclosed Rail Type—

Port Alfred Pulp & Paper Co., Port Alfred, Que., 135,000 sq. ft.
Newfoundland Power & Paper Co., Corner Brook, N. F., 43,000 sq. ft.

Southern International Paper Co., Bastrop, La., 98,000 sq. ft.
Southern International Paper Co., Camden, Ark., 85,000 sq. ft.
United Paperboard Co., Lockport, N. Y., 46,000 sq. ft.
E. B. Eddy Co., Hull, Que., 35,000 sq. ft.

Specifications, Enclosed Rail Type Monolithic Gypsum Slab Construction—The floors and roofs named herein shall be the Enclosed Rail Monolithic Gypsum Slab Construction as furnished by the LATHROP-HOGE GYPSUM CONSTRUCTION CO., Cincinnati, Ohio.

Standard rail sections designed to carry all loads between supports shall be set on walls, beams, or roof purlins at proper elevation to provide at least $\frac{3}{4}$ -in. covering of gypsum under their bottom flange. Across these rails shall be stretched galvanized mesh reinforcement, having .026 in. minimum area per foot of slab cross section, and allowed to sag to within $\frac{3}{4}$ -in. of temporary wood or other forms, making a continuous reinforcement at right angles to the rail subpurlins.

Standard gypsum composition containing at least 85% calcined gypsum shall be mixed with water to a medium quaking consistency, and poured into place on the forms, completely enclosing the rails to form a slab 3 in. thick (or more where specified). The top surface of slab shall be left ready to receive the finish desired, such as fill, grading, or waterproofing.

Overhangs in direction of span of rails shall be formed by extending same to required distance beyond the last purlin. Other overhangs shall be reinforced on the cantilever principle, with reinforcement embedded in the adjacent main slab and secured to the steel of the same.

Typical Monitor Construction

Curbs, walls, mullions, etc., shall be constructed with gypsum composition as above, sufficient steel reinforcement being provided to stiffen against wind pressure or other loading. Or such curbs, walls, mullions, etc., may be constructed of gyp-

sum composition blocks laid up in gypsum mortar, all joints to be struck, and outer surfaces on roofs left ready for waterproofing.

Typical Section Through End Wall of Sawtooth

Typical Details of Eave Purlin

Advantages of Rail Types

The rail types of construction have all the advantages of light weight, time saving construction, high insulation properties, fire resistance, vibration resistance, permanence and strength of the standard suspension type and eliminate the special steel designs required for that type.

It is readily applied to framing designs not laid out for the standard slab, in replacement of old roofs and floors where applications to framing are difficult, or where a uniform paneled under surface is desired.

The simplicity of the above designs permits adaptation to any layout of supports by varying the size of rails. No steel supports are required at the walls.

T System Rail System
Beam System Suspended System

Marks Poured-in-Place Gypsum Roofs

The Marks T System of Poured-in-Place Gypsum Roofs was designed primarily to eliminate the necessity of erecting temporary wooden forms for roof and floor slabs required in this type of construction. In the Marks T System the centering is composed of steel tees and gypsum board, and not only does this material act as a centering, but it remains in the roof construction and eliminates the dripping which is unavoidable in other forms of poured construction. The steel tees act as an additional load bearing factor and the gypsum boards become a part of the total thickness of the roof slab; so that this material, though acting as a form temporarily, actually becomes a part of the roof structure.

The galvanized welded wire reinforcement, in which the longitudinal members are spaced 4 in. apart and cross members 12 in. apart, is made in rolls of the same width as the space between the longitudinal

tees, and is continuous from one side of the roof to the other.

Advantages of This Construction—There are many:

Very frequently a considerable sum of money can be saved on account of its light dead load, especially if the Marks engineers are consulted before the steel columns, trusses, etc., have been designed.

The centering is practically tight and the aggregate poured does not drip through the slab, thereby keeping the interior of the building clean. There is, therefore, no inconvenience to any

Marks T System Roof in Process of Construction

E. G. Budd Manufacturing Co., Philadelphia, Pa.
 THE BALLINGER Co., Engineers
 WARK Co., General Contractors

other work going on in the interior of the building. Especially is this a very important factor in re-roofing old buildings where continuous operation is required.

In the Marks T System the underside is perfectly clean. All of the companies for whom the Marks T System Roof has

In the Marks T System the steel reinforcement, the important factor in the load bearing capacity of the roof, has a minimum protection of $\frac{3}{8}$ -in. thickness of gypsum board. No end bay bracing or tie rods are required with the Marks T System.

The combination of structural tees and reinforced gypsum on the Marks T System eliminates the possibility of sag between purlins. This construction is entirely above the purlins, and is adapted to meet any standard design of framework without changes or additions. Everything is furnished, including tees, materials and labor, completing the work ready for waterproofing.

Specifications for Marks T System Poured-in-Place Gypsum Roof

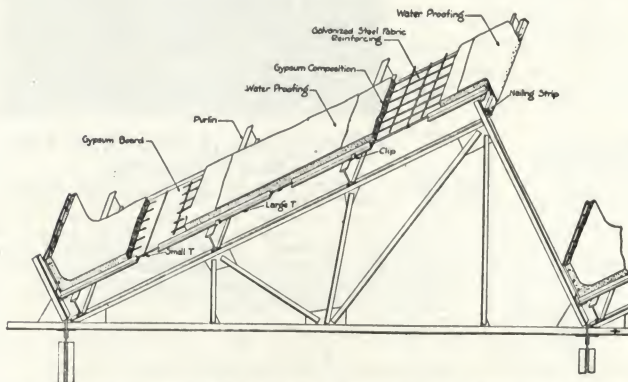

The roof decks shall be constructed of thickness of the Marks T System of Reinforced Gypsum in accordance with the details of construction as shown in the Marks catalogue. This work to be installed by the H. E. MARKS CORPORATION, Pittsburgh, Pa.

For Branch Offices and Agencies, see page B1614

Products

HEAT-INSULATING and SOUND-DEADENING "QUILT."

For Stained Shingles, see page A406; for Paints, Stains and Wood Preservatives, see pages B1614-1615.

Cabot's Heat-insulating and Sound-deadening "Quilt"

Purposes—For insulating houses and other buildings to make them warm in winter and cool in summer; for insulating cold storage and icehouses, breweries, refrigerators, etc., and for deadening sound in floors and partitions of apartments, schools, hospitals, lodges, etc.

Description—"Quilt" is a felted matting of eel grass stitched between two layers of very strong Kraft paper. It will sustain a pull of almost 900 lb.

Rolls of Quilt

Rolls of 250 sq. ft., 1 yd. wide
Divides into 18 in. strips

Ribbons of eel grass cross each other at every angle, making small cells of dead air. Quilt is a cushion of these air spaces. These give perfect conditions for insulating heat and deadening sound. Dead air can not circulate, preventing heat conduction; and sound waves are broken up and absorbed.

Grades—"Quilt" is regularly made in 5 grades, as follows:

Grade	Thickness, in.	Weight, lb. (per roll of 250 sq. ft.)
Single-ply	About $\frac{1}{8}$	About 40
Single-ply waterproof	About $\frac{1}{8}$	About 50
Double-ply	About $\frac{1}{4}$	About 60
Double-ply waterproof	About $\frac{1}{4}$	About 70
Triple-ply	About $\frac{3}{8}$	About 85

Efficiency—Tests by Prof. G. B. Wilkes of Massachusetts Institute of Technology give the following heat conductivities of Cabot's Quilt:

Single-ply	0.41
Double-ply	0.26

Prof. Wilkes shows, in the following table, the conductivities of standard wall and roof construction un-insulated and insulated with Cabot's Quilt, and the percentage heat saving effected by the Quilt insulation.

RELATIVE HEAT CONDUCTIVITY OF STANDARD WALL AND ROOF CONSTRUCTIONS—WITH AND WITHOUT CABOT'S QUILT INSULATION—SINGLE-PLY

Construction	Conductivities		Heat saving, per cent
	Not insulated	Insulated	
Standard Wall Construction			
Clapboard, sheathing, studding, lath, plaster.	0.28	0.16	43
8-in. bricks, furring, lath, plaster	0.27	0.16	41
4-in. tile, stucco outside, plaster inside	0.40	0.20	50
Corrugated iron.	1.50	0.32	79
12-in. stone.	0.49	0.22	55
12-in. concrete, furring, lath, plaster	0.40	0.20	50
Stucco, studding, plaster	0.45	0.21	53
Standard Roof Construction			
Tar and gravel on 4-in. concrete.	0.60	0.24	60
Tar and gravel on 2-in. wood plank.	0.26	0.16	39
Metal on tongue and groove sheathing.	0.42	0.20	52
Corrugated iron on wood frame	1.80	0.32	82
Tile or slate on wood sheathing.	0.82	0.27	67
Shingles, sheathing, studding, lath, plaster.	0.30	0.17	43
Shingles on shingle lath	0.64*	0.24	63

*Average value from Jones Tables, The Heating and Ventilating Magazine.

One layer of double-ply Quilt (less than $\frac{1}{2}$ in. thick) is a better insulator than 12 in. of solid brick-work and far better than 12 in. of concrete or stone.

Sound Deadening

Thousands of apartments, schoolhouses, hospitals, etc., have been successfully deadened in partitions and floors with Cabot's Quilt. It breaks up and absorbs sound waves. Most exhaustive practical tests made by Prof. C. L. Norton of the Massachusetts Institute of Technology for the New England Conservatory of Music showed Quilt far superior to all other methods tested.

Permanency

Insulators and sound deadeners should be as permanent as the building itself.

Cabot's Quilt is made of cured eel grass, which will not get foul or rot, nor harbor insects or vermin. (See old Pierce House below.) Quilt has been in use over 35 years without deterioration.

Fire Resistance

Quilt will not burn, and has proved its fire resistance in many buildings.

**Old Pierce House, Dorchester, Mass.
Built About 1635**

The walls of the old Pierce House, Dorchester, Mass., were stuffed with eel grass when the house was built about 1635, and the grass is still in a perfect state of preservation. We have a sample of this 290-year-old eel grass in our office

Flexibility

Quilt is flexible and will fit any surfaces, corners, projections or jogs.

Application

Quilt" can be applied in any way that any common felt or paper can be at the lowest labor cost.

The drawings shown on the following page are merely suggestions of a few methods of heat insulation in dwellings, etc., and of sound deadening in floors and partitions.

Adaptability

Single-ply is for lining houses and for all other ordinary heat insulation.

Double-ply is for house insulation and sound deadening.

Triple-ply is the best for cold storage and for deadening and other work where unusual conditions prevail.

Waterproof "Quilt" is covered with waterproof paper, for use under stucco and brick.

Specification

Specify Cabot's "Quilt" [Trade Mark], and state what grade shall be used.

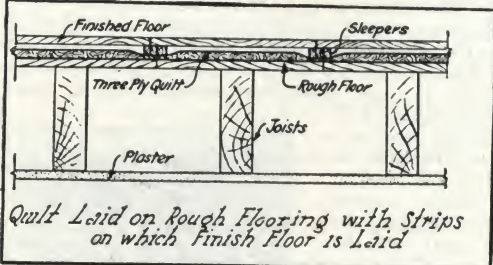

Samples

Samples of all materials, with full information, promptly furnished on request.

FLAX-LI-NUM IS RETAILED BY LUMBER DEALERS

Products

FLAX-LI-NUM INSULATION, for stopping heat losses through walls, floors, ceilings and roofs; for the insulation of refrigerators, railway refrigerator cars, refrigerating and cooling rooms, iceless shipping containers, fireless cookers, etc.

FLAX-LI-NUM for SOUND DEADENING floors and party walls in apartment and office building construction and acoustical treatment in halls, churches, studios, auditoriums and radio stations.

FLAX-LI-NUM KEYBOARD, an Insulating Plaster Base made up of sheets of Flax-li-num covered with waterproof paper, to which are stitched beveled white pine lath, to be used for outside sheathing under stucco or inside for plaster base.

Flax-li-num

Flax-li-num is used for the following purposes:

Building Insulation—Used as an insulating material, Flax-li-num stops the passage of heat and cold, resulting in cooler interiors in summer, and so reducing heat losses in winter that fuel costs are lowered 25% to 30%, smaller heating plants are required and less radiation is needed.

Correcting Condensation

—In factories, mills and warehouses where excessive condensation, due to extreme temperature differences and high humidity, is encountered. See Specifications 2-A and 14-A.

Refrigeration—In the construction of refrigerators and refrigeration equipment, Flax-li-num has many advantages that recommend it for this work. It is used extensively in a number of the better known refrigerators, and many hundreds of refrigerating and cooling rooms built with Flax-li-num bear out our claims that Flax-li-num is the correct insulation for this purpose.

Application of Flax-li-num to Sidewalls

Standard specifications on this type of construction are practically impossible to compile, since each job requires special treatment. The services of the Engineering Department are at the command of architects and engineers interested in this phase of Flax-li-num application.

Sound Control—Used to control sound, Flax-li-num effectively stops the transmission of noise through floors and walls. In correcting acoustical difficulties Flax-li-num is unexcelled for theaters, lecture and music halls, churches and broadcasting stations.

Advantages of Flax-li-num

Efficiency—An insulating material's efficiency depends upon

the number of minute dead air cells contained within its structure. Not only does flax fiber contain millions of such cells within its structure, but millions of additional air cells are formed between the fibers when they are felted into sheets. Hence, in Flax-li-num there is a maximum of air cell capacity.

Surface Resistance to Passage of Heat

—This is developed to its greatest extent in the methods of Flax-li-num application. Flax-li-num is designed for installation between the inner and outer surfaces of exterior walls. Thus surface resistance to passage of heat and cold is fully developed in addition to the well-known insulating superiority of Flax-li-num itself.

Correctly Made—No binder of any kind is used in Flax-li-num. The flax fiber is compressed to the correct density to provide maximum caged air capacity and still produce a semirigid sheet of sufficient strength to be self-supporting and at the same time making the sheets easy to handle and install.

Permanency—Flax being the basic material of linen, Flax-li-num fibers have the toughness, strength and long life of this material. Flax-li-num will not warp, tear, buckle, crack, bulge or break. Flax fiber does not rot, therefore Flax-li-num can not deteriorate. Because of its semi-flexible nature, when installed in a building, it will adjust itself to any changes developed in the building due to drying out of the timbers, or to settling or other causes. Flax-li-num will remain in place under the most adverse conditions.

These facts prove the permanency of Flax-li-num in building construction.

Vermiproof—The flax fiber going into the manufacture of Flax-li-num is chemically treated to resist attack by vermin and rodents. The material is thus rendered distasteful to vermin and they positively will not nest in it.

Stays in Place—Flax-li-num is guaranteed to stay in place during the life of the structure in which it is installed. In refrigerator cars, in service so long that the car sills had rotted away, Flax-li-num was found to be so well preserved that it was used over again. Flax-li-num is the standard insulation used in the majority of refrigerator cars on American railways.

Fits All Shapes—Flax-li-num is sufficiently flexible so that it easily fits around uneven or oddly shaped places, making tight joints.

Easy to Handle—Flax-li-num need not be handled carefully, consequently it saves time for the men installing it. Coming in convenient sized sheets, it is easily stored, handled with no fear of breakage or tearing and is installed rapidly.

Sizes—One-half inch thick Flax-li-num is made in sheets 16½ or 24½ in. wide, 8, 9 and 10 ft. long, flanged to fit between studs. ¾ and 1-in. thick Flax-li-num come in flat sheets 32 in. wide, 8 or 9 ft. long. ½-in. Flax-li-num can also be furnished flat same size sheets as the 1-in.

Flax-li-num is also made in special sizes for "headers" to be set between floor joists, pads for placing under partition walls at floor and ceiling levels and as joist pads.

No Fillers Required—No overlapping of sheets or fillers are required with Flax-li-num. Closely butted together, the flax fibers join or interweave to form what is practically a continuous sheet of material.

Application of Flax-li-num to Ceilings

The Flax-li-num Method

The Flax-li-num method of application, as recommended in our specifications over more than fifteen years, calls for applying Flax-li-num in the middle of the air space in side-walls and furred down on ceilings, thus giving an air space on each side of the material.

The object in this specification is to increase the efficiency of the insulating material by taking advantage of the added surface resistances.

These Flax-li-num specifications are the only insulation specifications recognizing the value of these air spaces in contributing additional surface resistances to the passage of the heat.

The United States Bureau of Standards in its recently published Circular Letter No. 227, says:

"If a layer of material (insulation) is placed in the middle of a wide air space such as that between the studs in a frame wall, greater additional insulating value is obtained than if the material is placed in contact with the sheathing, or as a plaster base. ***** The addition of a half-inch layer of insulation in the middle of the air space in a frame wall is therefore the equivalent of adding about a 3/4-inch layer at some other place in the wall."

Flax-li-num Keyboard

Flax-li-num Keyboard is composed of 1/2-in. Flax-li-num overlaid with one thickness of heavy saturated and coated asphalt paper upon which is wire-stitched No. 1 white pine beveled lath.

Keyboard is made for magnesite or portland stucco or plaster in sheets 48 in. by 3 ft. or 32 in. by 3 ft.

Specification Suggestions

Specify the exact places where Flax-li-num is to be used, bearing in mind that heat insulation is most effective when placed half-way between inner and outer surfaces of exterior walls, and between studs from sill to top plate. For sidewalls use 1/2-in. Flax-li-num. Sheets should be notched and flanged top and bottom, and form continuous contact all around. Nail lath over flanged edges at top, bottom and sides. In gables, blocks of studding dimension should be inserted between studding, flush with bottom edge of ceiling joists. Insulation should be run to these headers and fastened to them with lath.

Below top story ceiling joists, 1-in. Flax-li-num sheets should parallel the joists so that edges are backed by joists on both sides.

Below the Flax-li-num place 1 by 2-in. furring strips, to receive the lath and plaster.

Where top story is an attic, and it is desired to make this space easily usable, 1-in. Flax-li-num should be applied to underside of rafters and collar beams. At intersection of rafters and collar beams wood headers should be placed between rafters, and Flax-li-num nailed to headers. At all end joints of insulation insert wood headers and nail both sheets to these headers to assure tight joints.

In tile or brick walls, insert lath horizontally into mortar joints every 2 ft. To these nail 1 by 2-in. furring strips vertically on 16-in. centers. Apply Flax-li-num Keyboard (Specification 10-A).

For stucco exteriors, insert horizontal headers every 3 ft. between studding as nailing base for Flax-li-num Keyboard and to form heat and fire-stops in wall. Sheets of Keyboard should be butted tight and vertical joints broken every 3 ft. by using one-half of each standard size sheet of Keyboard (Specification 10-A).

Insulation for a One or Two-story House—Specification No. 13-A

Sidewall Insulation (Detail 3)—Materials—Heat insulation for all outside walls shall be 1/2-in. Flanged Flax-li-num, manufactured by the FLAX-LI-NUM INSULATING COMPANY, St. Paul, Minn.

Application—1/2-in. Flanged Flax-li-num sheets shall be applied between studding from lower to top plate. Top and bottom of sheets shall be notched and flanged into place. Furring strips (lath) shall be securely nailed through flanged edges and top and bottom of Flax-li-num sheets to studdings and plates (to insure airtight joints). In gables, blocks of studding dimension shall be inserted between studding flush with bottom edge of ceiling joists. Insulation shall be run to these headers and fastened to them with lath.

Roof Insulation (Detail 4)—Materials—Heat insulation for the roof shall be 1-in. Flax-li-num flat sheets, manu-

factured by the FLAX-LI-NUM INSULATING COMPANY, St. Paul, Minn.

Application—1-in. Flax-li-num flat sheets shall be applied to the underside of top floor ceiling joists. Insulation shall be furred out with 1x2's under joists to receive lath and plaster. At all end joints of Flax-li-num insert wood headers and nail both sheets to these headers to insure tight joints.

Insulation for Story and One-half Semi-bungalow—Specification No. 4-A (Details 3 and 4)

Sidewall Insulation—Same as Specification No. 13-A.
Roof Insulation—Apply flat sheets under collar beams and rafters. See Specification 13-A.

Heat Insulation for Brick Veneer Houses or Two Flats—Specification No. 8-A

Application for sidewalls and ceilings, same as in Specification No. 13-A, preceding. (See Details 3 and 4.)

Flax-li-num Keyboard Heat Insulation for Brick and Hollow Tile Houses, Bungalows or Two Flats—Specification No. 11-A

Sidewall Insulation (Detail 5)—Materials—Heat insulation for all outside walls shall be Flax-li-num Keyboard, manufactured by the FLAX-LI-NUM INSULATING COMPANY, St. Paul, Minn.

Millwork—Window and door frames shall be made to accommodate thickness of wall plus 3/4-in. furring strips plus 1/2-in. extra thickness for Keyboard.

Application—In laying tile walls insert lath horizontally into mortar joints every 2 ft. To these lath nail 1x2 furring strips vertically, on 16-in. centers. Apply Flax-li-num Keyboard, breaking vertical joints every 3 ft. Nail each lath on Keyboard into every furring strip with 6d nails. Apply plaster in usual manner, covering lath to a depth of 3/8 in.

Between first and second floors insert small pieces of Keyboard between joists to properly insulate this space.

Roof Insulation (Detail 4)—See Specification 13-A, preceding.

Deadening, Sidewall and Roof Insulation Where Studding Is Broken at Ceiling—Specification No. 3-A

Deadening (Detail 2)—Materials—Shall be 1/2-in. Flax-li-num flat sheets, 1/2-in. Flax-li-num Joist and Plate Pads, and 3/4-in. Flax-li-num flat sheets, manufactured by the FLAX-LI-NUM INSULATING COMPANY, St. Paul, Minn.

Application—Before placing joists, all top plates shall be covered with 1/2-in. Flax-li-num Plate Pads (the width of the joists).

Flax-li-num Joist Pads 1/2 x 3 in. x 3 ft. are to be placed on top edge of all joists and headers to receive flooring, which is to be laid diagonally and tight.

All lower plates are to be placed on 1/2-in. Flax-li-num Plate Pads, which will project 3/4 in. on each side of the plates on partition walls, and 3/4 in. on the inside of outside walls, to receive grounds for lath and plaster.

Before lathing, ceiling of lower floors shall be covered with 1/2-in. Flax-li-num flat sheets applied to the bottom edge of the ceiling joists, all joints to be well fitted and butted tight (to receive end joints 1x2 headers shall be placed between the joists).

Headers, joist dimensions, shall be placed between the joists over all bearing deafened partitions. Extra joists shall be placed directly over and below where deafened partitions parallel the joists.

Underfloors are to be covered with a continuous thickness of 1/4-in. Flax-li-num fitted tight against the plate pads, and finished floor is to be laid directly over Flax-li-num (no furring strips).

For Party Wall Application—See Specification No. 7-A, following (Detail 2).

Roof Insulation (Detail 4)—See Specification 13-A, preceding.

Sidewall Insulation—Material—Shall be 1/2-in. Flax-li-num flat sheets, manufactured by the FLAX-LI-NUM INSULATING COMPANY, St. Paul, Minn.

Application—From foundation to top floor ceiling line 1/2-in. Flax-li-num flat sheets shall be applied to the outer side of the sheathing. Flax-li-num shall be covered with a good grade of asphalt saturated paper and furred out over studding with lath. End and side joints are to be butted tight. Above

top floor ceiling line fur outside of sheathing with 1x2's and lay up walls.

For Fireproof Construction—Application details for deadening are shown in Detail No. 1.

Deadening, Sidewall and Roof Insulation Where Studding Is Not Broken at Ceiling Line—Specification No. 7-A

Deadening (Detail 2)—Materials—Shall be ½-in. Flax-li-num flat sheets, ½-in. Flax-li-num Joists and Plate Pads, ½-in. Flax-li-num headers and ¼-in. Flax-li-num flat sheets, manufactured by the FLAX-LI-NUM INSULATING COMPANY, St. Paul, Minn.

Floor Deadening Application—Flax-li-num Joist Pads ½ x 3 in. x 3 ft. are to be placed on top edge of all joists to receive underflooring which is to be laid diagonally and tight. At ceiling line and at floor line above, on all floors, ½ in. flanged Flax-li-num headers are to be fitted tightly between studdings in such a manner as to completely close openings. Before lathing, ceiling of lower floors shall be covered with a continuous layer of ½-in. Flax-li-num flat sheets nailed to underside of joists. All joints shall be fitted and butted tight against Flax-li-num headers which are between studdings. Over joists, Flax-li-num shall be furred out with 1x2's for lath and plaster.

Party Partition Deadening Application—Lay ½ x 4-in. Flax-li-num pads on plates below partitions before placing floor joists. Cut off corners of joists so that joists from one side of partition will not touch floor on the other side. Place ½ x 6 in. Flax-li-num pads between joists that support floor on one side of partition and joists that support floor on the other side. Insert wood headers, joist dimension, between joists directly under partition, separating headers from the joist with ½ x 3-in. Flax-li-num pad. Lay ½ x 4-in. Flax-li-num pads over these headers and intersections of joists and lay plate directly on pads. Apply ½-in. Flax-li-num sheets to partition on both sides, running Flax-li-num below rough floor and butting it against Flax-li-num pads under plate.

For Sidewall and Roof Applications—See Specification No. 3-A, preceding.

For Fireproof Construction—Application Details for Deadening are shown in Detail No. 1.

Deadening and Roof Insulation Where Outside Walls Are of Brick or Hollow Tile—Specification No. 5-A

Deadening (Detail 2)—Materials—Shall be ½-in. Flax-li-num flat sheets, ½-in. Flax-li-num Joist and Plate Pads and ¼-in. Flax-li-num flat sheets, manufactured by the FLAX-LI-NUM INSULATING COMPANY, St. Paul, Minn.

Floor Deadening Application—At ceiling line build wall offset 2 in. in from wall line and height of joists, making top of offset full and plumb with top of joists.

Place Flax-li-num Joist Pads ½ x 3 in. x 3 ft. on top edge of ceiling joists, also over the wall projections, to receive underflooring, which shall be laid diagonally and tight.

All ceilings are to be covered with a layer of ½-in. Flax-li-num applied to underside of joists. All joints to be well fitted and butted tight. Fur with 1x2's over Flax-li-num to receive lath and plaster.

Over rough flooring lay ¼-in. Flax-li-num flat sheets fitted tight against plate pads at partitions. Finished floors to be laid directly on ¼-in. Flax-li-num (no furring strips).

Party Partition Deadening Application (Detail 1)—Lower plates in partitions shall be placed on ½-in. Flax-li-num Plate Pads projecting ¾ in. on each side of plate. Upper plates shall be covered with ½-in. Flax-li-num Plate Pads. Both sides of all deadened partitions shall be covered with a continuous layer of ½-in. Flax-li-num, which shall be butted tight to plate pads on top and bottom. Fur out with 1x2's over Flax-li-num to receive lath and plaster. Place wood headers, joist dimension, between joists on all deadened partitions. Place extra joist directly over and below deadened partitions where these parallel the joists.

Roof Insulation (Detail 4)—See Specification 13-A, preceding.

Heat Insulation for Flat Roof Decks—Specification No. 2-A

Concrete Deck—(Detail No. 7)—Roof Deck (Concrete)—Shall be finished smooth, without depressions that could hold water, properly graded to drains, and thoroughly dry and clean.

Materials—Shall be 1-in. Flax-li-num, manufactured by the FLAX-LI-NUM INSULATING COMPANY, St. Paul, Minn. A

good grade roofing composition or cement shall be used for all moppings. Roofing as specified elsewhere.

Application—Where asphalt roofing composition is used, prime concrete surface, using at least 1 gal. of priming per 100 sq. ft. Where coal tar pitch roofing composition is used, priming not necessary. Mop thoroughly over deck and lay Flax-li-num into hot mopping, pressing down into mopping in workmanlike manner. Butt all ends tightly together to insure proper insulation at joints. Mop over Flax-li-num thoroughly and lay roof over hot mopping.

Important: Flax-li-num must be laid into roofing composition immediately after mopping or composition will become hard before sheets are laid. Do not lay more Flax-li-num than can be covered in a day. All edges or exposed parts of Flax-li-num to be covered with cap sheet mopped to deck, and reopened when work is resumed.

Wood Deck Where Excessive Condensation Is a Factor—Roof Deck (Wood)—Shall be well seasoned, narrow width lumber, properly nailed and free from wide cracks, knots and imperfections. Roof surface shall be smooth, clean and properly graded to outlets, without depressions which could hold water. Cant strips shall be applied at fire walls and elevations.

Materials—Shall be 1-in. Flax-li-num, manufactured by the FLAX-LI-NUM INSULATING COMPANY, St. Paul, Minn. An approved roofing composition shall be used for all moppings. A thoroughly saturated waterproof felt shall be used under the Flax-li-num.

Application—Lay one thickness of waterproof felt, overlapping joints at least 4 in. Lay Flax-li-num sheets over waterproof felt, butting ends and sides carefully to insure a continuous sheet of insulation. Run Flax-li-num to all walls and fit tightly around all openings in roof, nailing Flax-li-num every 12 in. along edges with large head roofing nails. Mop entire surface thoroughly, using sufficient roofing composition to waterproof insulation. Lay roof while mopping is hot. Do not lay more Flax-li-num than can be covered in a day. All edges and exposed parts of Flax-li-num to be covered with cap sheet mopped to deck and reopened when work is resumed.

Wood Deck Under Normal Humidity Conditions—Roof Deck—Same as above.

Materials—Flax-li-num mopping and roofing same as preceding roof. Omit waterproof paper under Flax-li-num.

Application—Same as above, except that waterproof paper under Flax-li-num may be eliminated.

Heat Insulation for Steel Deck Roofs—Specification 14A (Detail 8)

Roof Deck—Steel properly graded to drains, and thoroughly dry and clean.

Insulating Material—Shall be 1-in. Flax-li-num manufactured by the FLAX-LI-NUM INSULATING COMPANY, St. Paul, Minn. A good grade roofing cement shall be used for all moppings. Roofing as specified elsewhere.

Application—Mop thoroughly over steel deck with standard grade roof composition and lay Flax-li-num into hot mopping, pressing down into mopping in workmanlike manner. Butt all ends tightly together to insure proper insulation at joints. Run Flax-li-num tight to all walls and butt tightly at all openings in roof. Mop over Flax-li-num thoroughly and lay roof into hot mopping.

Important: See paragraph 4 preceding specification 2-A.

Technical Information and Engineering Service

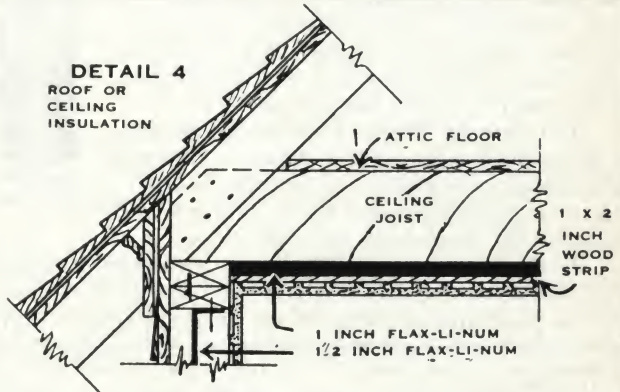

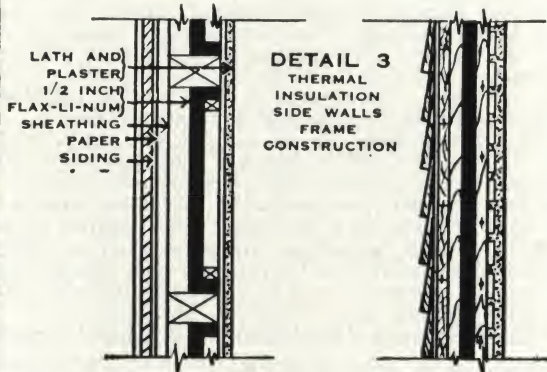

The foregoing specifications briefly review the various applications recommended by the FLAX-LI-NUM INSULATING COMPANY as minimum requirements for taking care of the job in hand. Each of these specifications are completely covered with full and complete detail drawings in our "American Institute of Architects' File No. 37b1," carrying the same specification number as given here. In addition, this company issues a treatise on "Heat Insulation for Houses," which is a compilation of the information gathered by the FLAX-LI-NUM INSULATING COMPANY over a period of eighteen years and covers not only laboratory tests, but the observation of complete practical applications in the field of building insulation.

These files will be gladly sent to architects and engineers on request.

Many jobs, particularly in the refrigeration field and in the field of sound control and acoustics, demand special handling. Here the experience of our own Engineering Department, in applying data and information collected by us, correlated with the best information procurable from noted refrigeration and acoustical engineers, is put at the disposal of architects and engineers who wish to make use of it. Communications addressed to the Engineering Service Department will be given prompt and intelligent attention.

C. S. GARRETT & SON CORP.

TELEPHONES Roofing, Building, Sheathing and Insulating Papers
 BELL, LOMBARD 6895
 KEYSTONE, MAIN 8567 PHILADELPHIA, PA.

Products

"RAWHIDE" WATERPROOF BUILDING, SHEATHING AND INSULATING PAPERS; "LIBERTY BLACK" INSULATING PAPERS; ASPHALT SHINGLES; DEADENING FELT.

"Rawhide" Waterproof Building Paper

The C. S. Garrett "Rawhide" is a high grade rope paper made of old manila rope stock, drawn out with a long fiber to give the best strength to the paper. The paper is treated with the "Rawhide" secret process to procure its waterproof qualities. It is odorless. "Rawhide" is put up in 36-in. rolls.

Made in two weights: No. 200 Buff, weighing 50 lb. per roll, and No. 215 Red, weighing 60 lb. per roll of 500 sq. ft. The No. 200 is the grade generally used for ordinary insulation. It has sufficient body to produce satisfactory results under ordinary conditions; but if the test is exceptionally severe the No. 215 is recommended.

For Use on Frame and Stucco Houses

—When used under slate, clapboards, shingles and stucco, "Rawhide" waterproof building paper is equal to a course of sheathing boards in protecting from cold and dampness.

In the accompanying illustration two types of stucco construction are shown. Type A has been given the only perfect permanency rating in the progress report of the

RAW-HIDE
WATER PROOF
PAPER

TRADE-MARK

Roll of
"Rawhide"

United States Bureau of Standards. No sheathing boards are used in this construction, the windproofing and weatherproofing being provided by waterproof building paper tacked in between the studs. For this purpose there is no better paper made than No. 215 "Rawhide" waterproof building paper.

Type B has furring and lath applied over sheathing, covered with waterproof paper. Either No. 200 or No. 215 "Rawhide" water-

proof paper will give satisfactory results for this purpose.

Specifications—Building or Insulating Paper—All material for insulating exterior walls and roofs shall be C. S. GARRETT & SON CORP. "Rawhide" Waterproof Building Paper. All sloping roof and deck surfaces and all sheathing on exterior walls shall be covered with No. 200 "Rawhide" Waterproof Paper.

Note: Where shingles strips are specified, building or insulating paper should be omitted.

All surfaces shall be completely covered in such manner as to make the building windproof and weatherproof subject to the approval of the architect. All joints of the paper shall be lapped not less than 2 in. and nailed with tin capped nails set not over 6 in. center to center. Carry paper into all window and door openings and under all window sills and exterior trim.

Type A Construction—The interior of all exterior studs shall have No. 215 "Rawhide" Waterproof Paper applied as follows: The paper shall be nailed with tin capped nails, spaced not over 6 in. center to center, to the inside face of the studs and secured to sides of the studs with vertical strips securely nailed to the studs after paper is applied. The paper shall be applied to the interior of all exterior wall surfaces in such manner as to make the building windproof and weatherproof subject to the approval of the architect.

For Cold Storage Insulation—"Rawhide" waterproof papers, on account of being odorless and impervious to dampness and moisture, are especially adapted for the insulation of cold storage houses, refrigerators, refrigerator cars and for all other purposes where a dependable waterproof paper is required. Samples will be sent on request.

"Liberty Black" Insulating Papers

Fiber stock, thoroughly waterproofed and evenly coated on both sides of the sheet. The heavy weighs 35 lb., and extra heavy 50 lb. per roll of 500 sq. ft. Recommended for good service where cheaper material than "Rawhide" is desired.

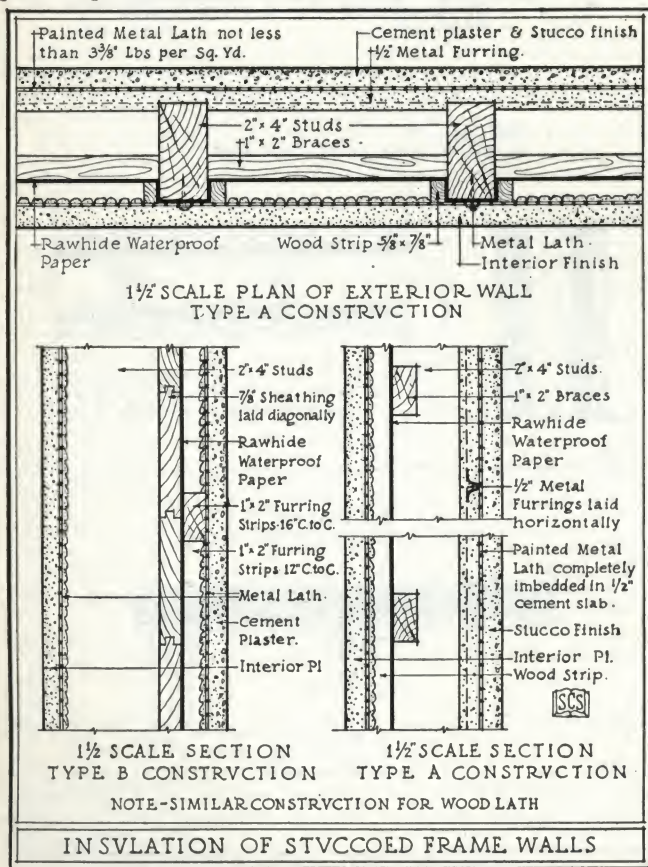

"Garrettite" Slate Surface Strip Shingles

The body of the Garrettite is wool fiber, made under our own formula and special supervision. We guarantee its uniformity. The felt is thoroughly asphalt saturated. It is then coated with a heavy layer of pure Gilsonite Asphalt; into which at high temperature is embedded a heavy coat of red, green and blue-black non-fading crushed slate.

Made in 3 styles: hexagonal, 3 shingles to a strip; octagonal and square butts, 4 shingles to a strip.

"C.S.G." Deadenng Felt

A high grade wool felt for deadening sound. Used between walls and under floors, it not only eliminates sound but acts as an insulator against heat and cold. Made in three weights: No. 18, 1 lb. per sq. yd.; No. 19, 1½ lb. per sq. yd.; No. 20, 2 lb. per sq. yd. We especially recommend the No. 20 for use in schools, churches and lodge rooms.

UNION FIBRE CO., INCORPORATED

All Forms of Insulation for Cold, Heat, Sound, Mechanical Vibrations,
Condensation and Acoustical Corrections

Engineers and Manufacturers

WINONA, MINN.

AGENTS IN ALL LARGE CITIES

Union Fibre Co., Incorporated Products—the Result of Twenty-five Years' Service and Experience

Materials to absorb as well as to prevent transmission of heat and sound:

LINOFELT.	MINERAL WOOL.
FIBROFELT.	ACOUSTICAL LINOFELT.
LITH.	ACOUSTIFIBROBLOCK.
PIPE COVERING.	ANTI-VIBRO-BLOC.

Note: Mineral Wool will stand 2500° F.

Safe temperature for our other materials is 280° F. and 35 lb. pressure.

Standard Specifications, Bulletins and Service

Standard drawings and specifications for the use of our products, will be mailed gratis.

We cheerfully furnish without charge bulletins and engineering advice concerning the use of our products.

Linofelt

A quilt, of highest efficiency, of selected flax fibre batt between tough Kraft or Waterproof paper. In rolls of varying widths and thicknesses.

Approximate Thickness— $\frac{5}{16}$ in.; $\frac{1}{2}$ in.; $\frac{3}{4}$ in.

Standard Widths—18, 24, 26, 32, 36, 48, and 54 in.; also any other special widths up to, and including, 108 in.

Approximate Weights per 100 Sq. Ft.— $\frac{5}{16}$ -in. Kraft, 17 lb.; $\frac{1}{2}$ -in. Kraft, 28 lb.; $\frac{3}{4}$ -in. Kraft, 39 lb.; $\frac{5}{16}$ -in. waterproof, 23 lb.; $\frac{1}{2}$ -in. waterproof, 32 lb.; $\frac{3}{4}$ -in. waterproof, 43 lb.

Fibrofelt

A pressed, flexible felt board of highest efficiency, of selected flax and rye straw fibres. In boards of varying widths, lengths, and thicknesses ($\frac{5}{16}$ to 1 in.), and especially adapted for roof insulation.

Approximate Thickness— $\frac{5}{16}$ in.; $\frac{1}{2}$ in.; $\frac{3}{4}$ in.; 1 in.

Widths— $\frac{5}{16}$ and $\frac{1}{2}$ -in. thicknesses are flanged for 16 and 24 in. on center. Also furnished flat in 32 and 36-in. widths; $\frac{3}{4}$ and 1-in. thicknesses furnished only in 32 and 36-in. widths.

Lengths—8, 8½, 9, 9½, and 10 ft.

Approximate Weights per 100 Sq. Ft.— $\frac{5}{16}$ in., 55 lb. uncrated, 65 lb. crated; $\frac{1}{2}$ in., 60 lb. uncrated, 70 lb. crated; $\frac{3}{4}$ in., 100 lb. uncrated, 110 lb. crated; 1 in., 115 lb. uncrated, 125 lb. crated.

On Concrete Roof

On Exterior Walls Finished
in Stucco

Plans for Application of Fibrofelt

Lith

A pressed board and prepared water repellent, 18x48 in., of selected flax fibre of highest efficiency. Especially adapted for cold storage and roof insulation.

Thicknesses—1, 1½, 2 and 3 in.

Approximate Weights per Square Foot—1 in., 1.25 lb. uncrated, 1.39 lb. crated; 1½ in., 1.88 lb. uncrated, 2.09 lb. crated; 2 in., 2.50 lb. uncrated, 2.79 lb. crated; 3 in., 3.75 lb. uncrated, 4.18 lb. crated.

Pipe Covering

Pressed and truly shaped from selected flax fibres. Used for cold pipes and sound deadening. Highest efficiency. Three thicknesses.

Brine Thickness—For brine and ammonia pipes with refrigerant from zero to 25° F. Also used for sound deadening. Thickness of covering from 2 to 3 in.

Special Thick Brine—For brine and ammonia pipes with refrigerant at a temperature below zero. Thickness of covering from 3 to 4 in.

Ice Water—For pipes carrying cold liquids, such as ice water, where temperatures are between 25 and 50° F. Thickness of covering from 1½ to 1¾ in.

Mineral Wool

Highest quality, no dust, and is not objectionable to handle when prepared by our patented process, which anneals and makes the fibres more pliable and tough, and prevents fibres from breaking up again into dust form. Packed in burlap bags of approximately 50 lb. each.

Grades—No. 1, unoled; No. 2, light oiled; No. 3, medium oiled; No. 4, heavy oiled.

Note: The oil anneals and waterproofs the wool fibres to a greater or lesser degree, depending upon the grade. The oiled wool is not greasy, as the oil is absorbed in the annealing process.

Acoustical Linofelt

Gives highest tests for sound absorption. Made from our best grade flax batt, burlap covered.

Made in standard rolls, 36 in. wide, 33½ ft. long, and 1 in. thick. Weighs, approximately, 60 lb. per square.

Acoustifibroblock

Highest grade and efficiency applied directly to surfaces. Its outer surface is the finished wall surface, in plain or tile effect. No surface membrane needed.

Made in slabs 18x48x1¾ in. Weights, approximately, 1.80 lb. uncrated, 2 lb. crated.

Anti-vibro-bloc

A super-insulation for elimination and deadening of severe vibrations and noises. Placed under machinery, in floors, walls, etc.

Made in slabs 18x48 in. and in thicknesses of 1, 1½, 2 and 3 in.

Approximate Weights per Square Foot—1 in., 1.33 lb. uncrated, 1.47 lb. crated; 1½ in., 2 lb. uncrated, 2.21 lb. crated; 2 in., 2¾ lb. uncrated, 2.96 lb. crated; 3 in., 4 lb. uncrated, 4.43 lb. crated.

THE SISALKRAFT COMPANY

918-20 Builders' Building
CHICAGO, ILL.

MILLS: AMERICAN REENFORCED PAPER COMPANY, ATTLEBORO, MASS.

Product

SISALKRAFT—a reenforced, waterproof paper.

SISALKRAFT

REG. U. S. PAT. OFFICE

Between or under the rafters on the roof, keeping heat in. As sheathing paper under brick veneer, stucco, shingles or clapboards.

Sisalkraft

This material has several new features peculiar to itself. Because of these features Sisalkraft can be used for many new purposes that are a big help to the contractor and builder.

Sisalkraft is made of two separate sheets of No. 1 kraft paper, two separate layers of asphaltum and two separate layers of the best grade Java rope sisal, one layer of which runs crosswise and one lengthwise with both layers firmly imbedded in the asphaltum. All these materials are rolled together under heavy pressure while hot, making an almost indestructible, thoroughly waterproof paper and giving Sisalkraft about 75% more strength than other papers.

Sisalkraft Ready for Second Layer of Asphaltum and Kraft Paper—Sisal Fibres Exposed

By almost indestructible we mean that it has strength enough to resist tearing in the wind, to withstand all kinds of rough handling, to present an almost unbelievable strength in the hands of the user. It is pliable enough to be pulled over corners or tucked into valleys and will not crack in the coldest weather.

Sisalkraft will not only shed water but will actually hold water without leaking for a period of four months by actual test.

Sizes and Weight

Sisalkraft is furnished in rolls of various widths, 36 in., 48 in. and 60 in. The 36 in. roll contains either 500 or 900 sq. ft. Other widths are 300 ft. long, giving 1200 or 1500 sq. ft. respectively. The weight of all sizes is approximately 5 lb. to a square.

Uses for Sisalkraft

For backplastering—to give double dead air space—keeping out heat, cold and dampness.

For lining the floors in public buildings, homes, etc., keeping out dust, dirt and moisture.

During the course of construction to protect stock piles, whether cement or lumber, covering in spaces left for doors and windows, for temporary partitions, contractors field houses, etc., as a wind shield or protectors on stagings, covering unfinished walls, temporary roofs.

On cement buildings to protect brick curtain wall when pouring cement under steel sash.

Coverings for cement roads and walks and other cement construction to keep off direct sun and heat so that concrete will not dry out too fast;

also to keep off heavy rain storms and as a protection to finished surfaces during the progress of other construction work.

For storm doors—in the country, in some sections, screen doors are covered with Sisalkraft in winter, converting them to storm doors.

For temporary garages, camps, enclosures for machinery, storage sheds, etc.

Covering for finished floors to protect them from painters, plasterers and other workmen.

Covering for finished interiors, walls, furniture, etc., when decorating.

Method of Use to Get Double Dead Air Space

Sisalkraft as Sheathing Paper

A typical group of houses upon which Sisalkraft has been applied as sheathing. Sisalkraft can be applied at least twice as fast as building papers due to the fact that tin caps or cleats are not necessary. An ordinary roofing nail will do. Note Sisalkraft covering stock piles in the foreground. This will be laid under the floors of other buildings after its use here.

A Few of the Advantages Found in Sisalkraft

(1) **Thoroughly Waterproof**—Having a double layer of asphaltum protected by the two layers of kraft paper on the outside Sisalkraft offers the cheapest means of applying asphaltum waterproofing.

(2) **75% More Strength Than Other Papers**—Sisal reenforcing both lengthwise and crosswise gives an almost unbelievable strength.

(3) **Time Saver**—(a) Sisalkraft can be applied by one man under the most unfavorable circumstances. No time is lost for careful handling. Sisalkraft is applied much tighter than any other paper without fear of tearing. Rough handling will not injure Sisalkraft.

(b) Battens or cleats are unnecessary—all that is needed is a large head roofing nail here and there.

(c) Contractors say they can lay three times as much Sisalkraft in one hour as any other paper. One man can handle Sisalkraft with ease.

(4) **Pliable**—(a) Sisalkraft can be roughed or mugged up, straightened out and used like a new piece.

Wall and Roof Application

Detail showing application of Sisalkraft in walls or roofs for the creation of dead air spaces. The method in both cases is practically identical.

(b) Sisalkraft can be folded tight over corners. Try a sample over your own desk or some handy corner. It can be pushed into valleys—not over them.

(5) **An Every-day and Every-season Paper**—

(a) Will not become brittle and crack during the winter months because the asphaltum is protected and remains pliable. Many dollars worth of labor are wasted because every time a workman touches a piece of paper it rips or breaks. There is so much waste with Sisalkraft.

(b) Sisalkraft will not stick in hot weather because the two layers of asphaltum are protected by kraft paper.

(c) Will not rip or tear in wind, and, of course, rain will not injure it.

(6) **An Excellent and Inexpensive Protection**—

Sisalkraft is the most economical material for covering stock piles, tops of foundations, brick walls, etc. If used for temporary partitions, field offices, closing-in, etc., rain and storm are kept out at a very low cost while the work continues. Sisalkraft can be taken off after such uses and used again.

FLOORS

Floor Applications

Sisalkraft should be used to secure the best results for floors, applying a layer of Sisalkraft over the sub-floor keeping lapped joints under the stripping. A second layer of Sisalkraft can be applied over the sleeper strips.

A number of field offices in New England have been used over a year—covered with Sisalkraft tacked on with ordinary roofing nails.

(7) **A Width for Every Purpose**—36 in. for sides of buildings, 60 in. for under floors and 48 in. for other purposes. Two widths can be seamed together to get greater width for covering purposes.

This Illustrates the Strength of a 4-in. Strip of Sisalkraft

(8) **Clean—Will Not Stain**—The asphaltum is protected on both sides by kraft paper.

Sisalkraft was laid over the rugs in a model home and the contractor says, "Your Sisalkraft did a wonderful job laid in the line of march through the furnished house to protect the rugs and finished floors. Nearly 10,000 persons went through this house without the slightest damage to either rugs or floors."

(9) **Economical**—(a) Every inch of Sisalkraft can be used.

(b) Can be used over again in temporary construction work. When building a number of homes the finished floors of the first building can be covered with Sisalkraft to protect them from paint, etc., and from workmen and then rolled up to be used on the floors of other buildings or as sheathing or floor linings.

(10) **Tight, Windproof Application**—(a) Sisalkraft is unexcelled as sheathing paper under stucco, brick veneer, shingles, clapboards, etc., and lasts for many years.

(b) When used as sheathing paper or between the studs and rafters to form dead air spaces Sisalkraft is unsurpassed for its insulating effect because it can be pulled up tight, applied without cracks and rips and completely prevents air seepage.

Samples and Information

File size samples will be sent on request. These samples will readily demonstrate the unbelievable strength of Sisalkraft, its complete waterproof character and its ability to withstand all kinds of abuse. Data sheets with examples of application will be sent on request.

SPRAYO-FLAKE INSULATING CO.

All Purpose Insulation Applied by Air

56 South Bay Street
MILWAUKEE, WIS.

Sprayo-Flake Insulation

Description—A new insulation consisting of flakes of pulp paper applied with a special spray gun. As the dry paper flakes leave the gun nozzle they are combined with a fine spray of silicate of soda which not only provides the necessary cohesive agent but also adds fire retarding qualities.

Efficiency—The material as applied is light and fluffy yet uniformly compact—it tenaciously holds its original position in spite of vibration. Since the insulating efficiency of any material depends primarily on its lack of density, Sprayo-Flake, obviously, rates extremely high as a heat and sound insulator.

In general characteristics, as applied, it is similar in appearance and composition to a wasp's nest.

Will Not Support Combustion—The material when in position will not support combustion.

Easily and Quickly Applied—Sprayo-Flake is easily and rapidly applied to any surface and is built to any thickness or shape required. Crevices, holes and places usually inaccessible are easily filled and sealed with the spray gun.

Furnished and Applied by Sprayo-Flake Co.—Sprayo-Flake Insulation is furnished, erected, or applied by the SPRAYO-FLAKE INSULATING Co. or their authorized agents, assuring complete, effective installations at reasonable cost.

UNITED STATES MINERAL WOOL COMPANY

TELEPHONE CONNECTION

280 Madison Avenue
NEW YORK, N. Y.

FACTORY: STANHOPE, N. J. (Railroad Station, Netcong, N. J.)
WESTERN CONNECTION: INSULATING PRODUCTS Co., 1553 W. Madison Street, CHICAGO, ILL.

Product

MINERAL WOOL, a Non-combustible Insulator and Sound Deadener.

Character of Mineral Wool

A mineral substance, made by converting melted scoria into a fibrous state.

It holds from 92 to 96% of air in suspension, which is more than any other non-combustible substance.

Uses

Mineral Wool is extensively used for insulating ovens and heat treating furnaces; and by leading manufacturers of refrigerators, ice and refrigerating machinery, as well as for filtering acids and the packing of carboys.

In residences it is used for lining walls, floors, roofs and ceilings, as partly shown in the accompanying illustration. It is cheap and easily applied.

A house lined with Mineral Wool is warm in winter, cool in summer, and is thoroughly deafened. The lining is verminproof, checks the spread of fire and keeps out dampness.

How to Estimate

To find the quantity of Ordinary Mineral Wool required to fill the outside walls the full thickness of studding:

Rule—1 lb. per sq. ft. for each inch in thickness.

Take the entire distance around the building on a horizontal line and multiply by the height of the studding, which will give the square feet of outside surface. Deduct, ordinarily, one-third to one-half for space occupied by doors, windows, chimneys, studding, bracing, etc. Multiply the remainder by the thickness of the studding; the result will be the number of pounds of Mineral Wool required to fill the space.

Grades and Cost

The Ordinary grade of Mineral Wool (the quality invariably used in building construction) weighs about 1 lb. per sq. ft., 1 in. thick, or 12 lbs. per cu. ft.

It costs \$30.00 (subject to change) per ton at factory. Within a radius of 200 miles from New York, N. Y., \$10.00 per ton will usually cover freight charges. A laborer can apply from $\frac{1}{2}$ to $\frac{3}{4}$ of a ton a day.

The Selected grade of Mineral Wool, which is used in chemical plants, is rarely called for in buildings.

Package

The material is packed in 3-bushel burlap bags, for which a charge of 15¢ (subject to change) each is made; if returned in good condition within 30 days, and free of all freight charges, they are credited at 10¢.

A Few Applications of Mineral Wool

How to Specify

"Insulation of Mineral Wool (UNITED STATES MINERAL WOOL COMPANY, 280 Madison Avenue, New York) shall be provided for For floors, it shall be [4 in.] thick and set upon boards placed between beams on cleats. For walls it shall fill the spaces between studs and be placed in position as the lathing is being proceeded with. For roofs, it shall fill the space between rafters from eaves to [collar beams]. The Wool shall be pressed compactly but lightly."

Samples

Samples and descriptive pamphlets will be gladly supplied, on application.

Balsam-Wool Refrigerator Car Insulation.

Balsam-Wool Steel Passenger Car Insulation.

Balsam-Wool Sound Absorbent for acoustical treatment in offices, banks, auditoriums, churches, hospitals, schools, broadcasting studios, etc.

Note: While this is used in acoustical correction, the material in these pages deals with sound insulation or the prevention of the transmission of sound through walls and floors. Complete information relative to Balsam-Wool Sound Absorbent, its use and application in acoustical work will be furnished on request.

Balsam-Wool Standard Building Insulation

A Wood Product—Balsam-Wool is made from pure wood fibers in fleecy wool form, permanently matted together and treated chemically to resist fire. For building purposes it is furnished $\frac{1}{2}$ and 1 in. thick, between two sheets of asphalt-coated tough kraft paper.

Highly Efficient as a Heat Insulator—In Balsam-Wool the natural heat resistance of the wood is multiplied many times by a rearrangement of the cellular wood fibers into a "wool" form which retards the circulation of air. The still air space in Balsam-Wool is approximately 95%, while its density in pounds per cubic foot is only 3.80. The fact that the paper liners of Balsam-Wool are *not stitched* or punctured in any way adds further to its heat, moisture and wind resisting qualities. Standard specifications, and test results showing the efficiency of Balsam-Wool compared with other building insulations are given in this article.

An Effective Sound Deadener—The ability of the wool to absorb sound, and the tendency of the paper covering to reflect sound waves, account for the remarkable efficiency of Balsam-Wool as a sound deadener. Standard specifications and comparative tests are given in this article.

Waterproof—The film of asphalt which lines the paper coverings protects

THERMAL CONDUCTIVITIES OF HEAT INSULATORS

Tests made by C. F. Burgess Laboratories, using standard hot plate method

Insulating material	Thickness, in.	§ Thermal Conductivity in B.t.u.		Density in lb. per cu. ft.
		1 hour	24 hours	
Balsam-Wool	.60	.249	5.976	3.80
*A	.35	.255	6.120	5.45
*B	.38	.270	6.480	14.00
*C	.50	.279	6.696	15.90
*D	.40	.309	7.416	5.07
*E	.43	.317	7.608	15.80
*F	.67	.318	7.632	15.90

*Insulating materials in competition with Balsam-Wool.

§Per square foot per 1°F. drop per 1-in. thickness.

TRADE-MARK

the wool from moisture, and at the same time keeps dampness out of the building.

Fire Resistant—The wool is chemically treated against fire.

It will char while exposed to flame, but will not smolder or burn after the flame is removed. Balsam-Wool in itself will not support combustion.

Vermineproof and Sanitary—Balsam-Wool contains no animal matter. It does not attract or harbor rats, mice or vermin. It is clean, odorless and sanitary.

Permanent—The wool can not shift or settle because each fiber is coated with an adhesive which cements it to adjoining fibers. The asphalt coating provides a permanent bond between wool and paper. Balsam-Wool is as permanent as the walls which hold it.

Uniform in Quality—During the process of manufacture, Balsam-Wool is under constant laboratory supervision for uniformity and thermal conductivity.

Low Cost of Installation—Three standard widths meet all average construction requirements. Thus, the carpenter cuts only to length. Being flexible, Balsam-Wool can be fitted easily into corners and around projections without waste of material. Being light and easily installed, it speeds up the work and keeps down installation costs.

Widths and Thicknesses—The standard widths are 17, 25 and 33 in. The standard thicknesses are $\frac{1}{2}$ in. for side walls, and 1 in. for roofs or top floor ceilings. The $\frac{1}{2}$ -in. thickness weighs 200 lb. per 1000 sq. ft., and the 1-in. thickness 330 lb. per 1000 sq. ft.

How Distributed—Balsam-Wool Standard Building Insulation is distributed through retail lumber dealers. Stocks are carried by dealers in all sections, and any retail lumber dealer can promptly obtain a supply.

A Weyerhaeuser Product

Balsam-Wool bears the name of an organization which for more than 68 years has been known for the high standard of quality maintained in all its products. On every roll of genuine Balsam-Wool will be found the Weyerhaeuser Forest Products trade-mark, the maker's pledge of personal responsibility.

EFFICIENCY OF VARIOUS SOUND INSULATORS

Heat Insulation for Buildings

Practical Insulation Tests—In the effort to obtain practical insulating data for architects, a series of tests was recently conducted for WOOD CONVERSION COMPANY by the C. F. Burgess Laboratories of Madison, Wis.

Made on Actual Wall and Roof Sections—The roof and wall sections tested were of standard construction, and included types most commonly encountered in residential work.

First, each section was tested for its thermal conductivity without insulation. Commercial insulating materials, purchased from dealers' stocks, were then applied in turn, so that the series of tests would show (1) the absolute heat loss through each type of wall or roof, insulated and uninsulated, and (2) the relative efficiency of the different insulators *under actual service conditions*.

Standard heat transmission test methods were employed. Details of these will be furnished on request.

Balsam-Wool the Most Efficient—Results of these tests show a wide difference in the efficiency of the eight insulators under trial. As might be expected, their relative standing varies somewhat in the case of the different wall and roof constructions to which they were applied, but in every case the heat loss through Balsam-Wool was shown to be the lowest.

General Conclusions—Test results show that the heat loss through the roof is relatively greater than through the walls. They also show that the amount of heat loss in either case is largely dependent on the building materials employed.

The percentage of saving due to insulation is highest in the case of those walls and roofs which showed the greatest amount of heat loss when uninsulated. However, the results show that there is a large preventable waste of heat through uninsulated walls and roofs of *every* type.

The Economies of Insulation—In the light of these tests and the actual results obtained in insulated buildings, insulation must be recognized as an important measure of fuel conservation.

Thousands of insulated houses throughout the country are burning from one-fourth to one-third less coal than uninsulated houses of the same size. Moreover, heating engineers are suggesting a reduction of as much as 20% in boiler capacity and radiation when proper insulation is specified.

These economic considerations, together with summer and winter comfort and the protection against sudden temperature changes, explain the popularity and greater resale value of the insulated house.

Standard Specifications for Heat Insulation of Buildings with Balsam-Wool

Materials

Heat insulation shall be standard Balsam-Wool, manufactured by the WOOD CONVERSION COMPANY, Cloquet, Minnesota. The ½-in. thickness shall be used for sidewalls and the 1-in. thickness for top floor ceiling or roof insulation. Widths shall be as specified hereinafter. (Stock widths are 17, 25, and 33 in.)

General

Continuity of insulation shall be maintained. Where floors, ceilings or roofs are insulated, as well as outside walls, insulate walls thoroughly between joist and rafter ends.

Throughout, all joints shall be made airtight, especially at door and window openings.

Use full length strips of insulation. End joints, where necessary, shall be lapped and covered with lath, nailed through insulation to boarding or header.

Insulation strips shall in all cases run in the same direction as studding, joists and rafters.

Frame Outside Wall Insulation

(Wood siding, stucco or brick veneer finish. Studs set on 16-in. centers.)

Method No. 1 (17-in. Width)—Insulate with 17-in. width Balsam-Wool applied vertically between studding with back of insulation near face of sheathing. The flanges or turnouts shall be continuously fastened by means of laths or strips nailed securely through insulation to the studding on the sides and to soles, plates or headers at the top and bottom.

Note: Where studding is set on 24-in. centers use 25-in. width Balsam-Wool.

Method No. 2 (33-in. Width)—Insulate with 33-in. width Balsam-Wool applied vertically on inside face of studding, edges butted together on every other stud. Fur over insulation with 1x2-in. furring strips on each stud to receive lath and plaster.

Note: This method requires special width door and window frames. Where heating or plumbing pipes are installed in space between studs of outside walls, insulate between studs as in Method No. 1, in addition to insulation as above.

Masonry Outside Wall Insulation

(Stone, brick, hollow tile or concrete block)

Method No. 1 (33-in. Width)—Fur the wall with 1x2-in. furring strips on 16-in. centers, shimmed plumb and true. Insulate with 33-in. width Balsam-Wool applied vertically on inside of furring, edges butted together on every other strip. Fur over insulation with 1x2-in. furring strips on each wall-furring strip to receive lath and plaster.

Method No. 2 (17-in. Width)—Fur the wall with 2x2-in. furring strips, on 16-in. centers, shimmed plumb and true. Insulate with 17-in. width Balsam-Wool applied vertically between furring strips with back of insulation against inside face of wall. The flanges or turnouts shall be continuously fastened by means of laths or strips nailed securely to the furring on the sides and to soles, plates or headers at the top and bottom.

Roof Insulation

(Rafters set on 16-in. centers)

Method No. 1 (17-in. Width, 1-in. Thickness)—Insulate with 17-in. Balsam-Wool applied between the rafters with back of insulation against inside face of roof boarding. The flanges or turnouts shall be continuously fastened by means of laths or strips nailed securely through insulation to the sides of rafters, plates, ridges, etc.

Note: Where rafters are set on 24-in. centers use 25-in. width Balsam-Wool.

Method No. 2 (33-in. Width, 1-in. Thickness)—Insulate with 33-in. width Balsam-Wool applied on the inside face of rafters, edges butted together on every other rafter. Fur over insulation with 1x2-in. furring strips on each rafter to receive lath and plaster. (Use laths or strips if space under rafters is unplastered.)

Ceiling Insulation

(Joists set on 16-in. centers)

(Use instead of roof insulation for second floor ceilings where attic above is not to be used for living quarters; also for basement ceilings where space is unheated; and for porch ceilings where space above is used for living quarters, as in second floor extensions, etc. Insulation is also recommended for first floor ceilings under bedrooms that will be cold at night, and for ceilings of first floor bedrooms where space above is heated at night.)

Method No. 1 (17-in. Width, 1-in. Thickness)—Insulate with 17-in. width Balsam-Wool applied between joists with back of insulation against underside of rough flooring (if applied from below) or against lath and plaster (if applied from above). The flanges or turnouts shall be continuously fastened by means of laths or strips nailed securely through insulation to the sides of joists, plates, headers, etc.

Note: Where joists are set on 24-in. centers use 25-in. width Balsam-Wool.

Method No. 2 (33-in. Width, 1-in. Thickness)—Insulate with 33-in. width Balsam-Wool applied on the bottom of joists, edges butted together on every other joist. Fur over insulation with 1x2-in. furring strips on each joist to receive lath and plaster or ceiling.

Floor Insulation

(Over partially excavated or cold basement areas. Joists set on 16-in. centers.)

Method No. 1 (33-in. Width)—Insulate with 33-in. width Balsam-Wool applied over subfloor, edges butted together over every other joist. Fur over insulation with 1x2-in. furring strips secured over each joist to receive finish floor.

Note: Where entire building floor area is not insulated as above, set floor joists of insulated area sufficiently below normal joist level to compensate for thickness of insulation and stripping.

Method No. 2 (17-in. Width)—(Use where headroom below joists is sufficient for working space and is accessible.) Insulate with 17-in. width Balsam-Wool applied between joists as specified in Method No. 1 for Ceiling Insulation.

Sound Insulation for Buildings

Sound Transmission Tests—In order to furnish architects with authoritative and workable data on the problems of sound insulation, as encountered in the design of apartments, hotels, hospitals and schools, WOOD CONVERSION COMPANY several years ago began a series of exhaustive researches through the C. F. Burgess Laboratories.

The problem of sound insulation may be defined as "finding effective methods of arresting the transmission of sounds." In other words, it must be distinguished from sound absorption problems, as encountered in auditoriums and banking rooms. Information on this latter subject has long been available, but before the Burgess tests there was no practical method of measuring the sound transmission through different materials and structural units.

Made on Actual Floor and Wall Sections—The Burgess tests were made on actual floor and wall sections. The amount of sound transmitted through an uninsulated floor (or wall) was taken as 100%. Conversely, the sound stopped was 0%. Various insulated floor and wall constructions were rated by this standard. Full details of the test methods, which were developed specially, will be furnished on request.

Three Series of Tests—In the first series, the aim was to find the relative soundproofing value of various commercial insulating materials.

The results give Balsam-Wool the highest rating—38%, as against 4.4% for the least efficient material.

In the second series, the aim was to find the relative sound insulating efficiency of various floor constructions insulated with Balsam-Wool. (Figs. 1 to 5 on the following page.)

The third series was similar to the second, except that the tests were made on walls. (Figs. 6 to 10.)

General Conclusions—These sound tests developed important general conclusions, as follows:

- (1) Joist pads do not reduce the sound transmission if the floor is nailed through the joist pads into the joists.
- (2) The greater the amount of pressure on an insulator, the greater the amount of sound which it transmits.
- (3) Little of practical value is gained by offsetting the furring strips from directly over the floor joists.
- (4) Of all types of floor construction, the suspended ceiling construction showed the greatest sound resistance. (Figs. 3 to 5.)
- (5) Of the wall types studied, double studding staggered construction showed the greatest sound resistance. (Figs. 8 to 10.)
- (6) The manner of applying the insulation, and the number of layers, have a marked effect on sound resistance.

Standard Specifications for Sound Deadening Floors and Walls with Balsam-Wool

Material

Sound deadening material (insulation) shall be standard $\frac{1}{2}$ or 1 in. thick Balsam-Wool, 33 in. wide, manufactured by the WOOD CONVERSION COMPANY, Cloquet, Minn.

Floor Sound Insulation—General

Continuity of the sound deadening material shall be maintained—all joints shall be lapped at least 2 in.

Where false ceiling construction is used (ceiling joists independent of floor joists) and sound deadening material is woven between the two sets of joists, insulating strips shall run at right angles to joists, with edge laps of at least $1\frac{1}{2}$ in. Tension on all strips shall be as nearly equal as possible to guard against open joints at edge laps.

Insulation strips applied over subfloor or on bottom of joists, shall run in the same direction as joists. Strips shall be flanged at all walls to permit a 4-in. turn up under baseboard tight against wall.

Use full length strips of insulation. End joints where necessary shall be lapped $1\frac{1}{2}$ in. and covered with lath nailed through insulation to subfloor, joist or header.

Where specified, there shall be constructed a false ceiling; the joists to support the floor and those carrying the ceiling being independent. The ceiling joists shall be set midway between the floor joists with bottoms at least $1\frac{1}{2}$ in. below the bottom line of the floor joists where woven insulation is used.

Floor Sound Insulation—Methods

(Methods herein specified are arranged from low to high, in order of their effectiveness.)

Method No. 1 (One Layer, 15% of Sound Stopped)—Insulate with Balsam-Wool applied on the bottom of joists, edges butted together on every other joist. Fur over insulation with 1x2-in. furring strips on each joist to receive lath and plaster. (Fig. 1.)

Method No. 2 (One Layer, 43% of Sound Stopped)—Insulate with Balsam-Wool applied over subfloor with edge laps of at least $1\frac{1}{2}$ in. Fur over insulation with 1x2-in. furring strips over each joist to receive finish floor. (Fig. 2.)

Method No. 3 (Two Layers, 52% of Sound Stopped)—Insulate with two layers of Balsam-Wool. The first layer shall be applied on the bottom of joists, as specified in Method No. 1, and the second layer shall be applied over the subfloor as specified in Method No. 2. (Fig. 3.)

Note: Methods 4, 5, 6 and 7 are used with false ceiling construction, as specified in the last paragraph under "Floor Sound Insulation—General."

Method No. 4 (One Layer, 75% of Sound Stopped)—Insulate with Balsam-Wool woven between the two sets of joists and secured to the bottom of each floor joist with laths or strips (or tin discs) nailed through the insulation. (Fig. 4.)

Method No. 5 (One Layer, 84% of Sound Stopped)—Insulate with Balsam-Wool applied on subfloor, as specified in Method No. 2. (Fig. 5.)

Method No. 6 (Two Layers, 86% of Sound Stopped)—Insulate with two layers of Balsam-Wool. The first layer shall be applied over subfloor, as specified in Method No. 2, and the second layer shall be woven between the two sets of joists as specified in Method No. 4.

Note: Insulation applied on bottom of ceiling joists as in Method No. 1, in lieu of woven insulation, rates the same.

Method No. 7 (Three Layers, 88% of Sound Stopped)

—Insulate with three layers of Balsam-Wool. The first layer shall be woven between the two sets of joists as specified in Method No. 4; second layer shall be applied under joists as specified in Method No. 1; third layer shall be applied over subfloor as specified in Method No. 2.

Frame Wall Sound Insulation—General

Continuity of the sound deadening material shall be maintained—all joints shall be sealed.

Where floors and ceilings are insulated, as well as partition walls, insulate thoroughly between joist ends.

Where double partition (staggered stud) construction is used and sound deadening material or insulation is woven between the two sets of studding, insulating strips shall run horizontally at right angles to studs, with edge laps of at least $1\frac{1}{2}$ in. Tension on all strips shall be as nearly equal as possible to guard against open joints at edge laps.

Insulation strips applied on the face of studding shall run vertically in the same direction as the studs.

Use full length strips of insulation. End joints, where necessary, shall be butted and covered with lath nailed through insulation to stud or header.

Where specified, there shall be built double partition walls of staggered stud construction, each set of studs set on 16-in. centers, the one set of studs centering between the others. On the same side of the partition there shall be at least $1\frac{1}{2}$ in. from the face of one set of studs to the face of the other where woven insulation is used.

Frame Wall Sound Insulation—Methods

(Methods herein specified are from low to high, in the order of their effectiveness.)

Method No. 1 (One Layer, 28% of Sound Stopped)—Insulate with Balsam-Wool applied on one face of studding only, edges butted together on every other stud. Fur over insulation with 1x2-in. furring strips on each stud to receive lath and plaster. (Fig. 6.)

Method No. 2 (Two Layers, 48% of Sound Stopped)—Insulate with two layers of Balsam-Wool applied on the two faces of studding, as specified in Method No. 1. (Fig. 7.)

Note: Methods 3, 4, 5 and 6 are used with double studding staggered construction, as specified in the last paragraph under "Wall Sound Insulation—General."

Method No. 3 (One Layer, 57% of Sound Stopped)—Insulate with Balsam-Wool woven between the two sets of studding and secured on the face of every stud of one set with laths or strips (or tin discs) nailed through insulation. (Fig. 8.)

Method No. 4 (One Layer, 66% of Sound Stopped)—Insulate with Balsam-Wool applied on the face of one set of studding, as specified in Method No. 1. (Fig. 9.)

Method No. 5 (Two Layers, 73% of Sound Stopped)—Insulate with two layers of Balsam-Wool applied on the face of each of the two sets of studding, as specified in Method No. 1. (Fig. 10.)

Method No. 6 (Three Layers, 77% of Sound Stopped)—Insulate with three layers of Balsam-Wool. One layer shall be woven between the two sets of studding as specified in Method No. 3, and one layer shall be applied on the faces of each of the two sets of studding, as specified in Method No. 1.

Tile Partition Wall Sound Insulation—General

Sound deadening material between double tile or gypsum block partition walls shall be $\frac{1}{2}$ or 1-in. thickness Balsam-Wool. Special care shall be taken that the edges are lapped and that the material be fastened securely to floors, walls and ceilings.

Tile Wall Sound Insulation—Method

Insulate with $\frac{1}{2}$ or 1-in. Balsam-Wool suspended vertically from top of first wall of double partition, edges to be lapped at least 2 in., with overlap of 3 to 4 in. at top, bottom and sides, overlap to be securely fastened with strips.

TEST RESULTS SHOWING RELATIVE SOUND DEADENING EFFICIENCY OF VARIOUS TYPES OF FLOORS INSULATED WITH BALSAM-WOOL

Fig. 1
Per cent of sound stopped, 15

Note: The amount of sound transmitted through a floor section constructed in the usual manner and without any insulation was taken as 100% sound transmission (or 0% sound stopped). The various types of floors insulated with Balsam-Wool were rated against this figure.

UNIVERSAL GYPSUM & LIME CO.

Manufacturers of Insulex, a Gypsum Insulation

Conway Building
CHICAGO, ILL.

For Sales Offices, see page B1362

Product

INSULEX, the Gypsum Insulation.

For Wall Board, see page B1259; for Gypsum Plasters and Finishes, Partition Tile, and Stucco, see pages B1362-1364.

Insulex

Insulex is aerated or cellular gypsum, a fire-, vermin- and decay-proof insulation and sound deadener, employed on roofs, floors, sidewalls and ceilings of residences, commercial and industrial buildings, and for industrial uses such as pipe and boiler covering, etc. Insulex is used as a light weight fill for reducing dead load in structures.

Main Uses—Insulation against heat and cold. Sound deadener. Light weight fill for floors and roofs. Fireproofing. Industrial uses such as insulating coke ovens, bake ovens, enameling ovens, dryers, roofs of clay plants, lumber kilns, boilers, hot water tanks, high pressure steam pipes, pipe chases, outside water towers, underground heating mains, bakeries, constant temperature rooms, etc., fireproofing built in vaults, light structural steel and other uses suggested by those enumerated above.

Description—Insulex is aerated or cellular gypsum and is used for sound deadening and insulation against heat and cold. It is light in weight and its structure consists of millions of tiny dead air cells, each incased in a mineral wall of gypsum, itself of low conductivity. It comes in powdered form, put up in 80-lb. sacks. No. 12 Insulex is also put up in 40-lb. paper sacks. Each sack is marked with the trade-name "Insulex Gypsum Insulation" and full directions are given on each sack for mixing and application. Insulex, when mixed with water, expands $2\frac{1}{2}$ to 7 times, depending on kind and for purpose used. It sets in 20 to 30 minutes. Tiny confined dead air cells are formed by millions, creating a remarkable resistance to heat, cold and sound. Any desired thickness or shape can be installed.

Insulex is supplied to make different finished weights per cubic foot—12, 18, 24 and 30 lb. per cu. ft. being the usual standards. The numbers on the sack indicate the weight per cubic foot of the set material in place.

Advantages—Insulex is fire-, vermin- and decay-proof and does not disintegrate in any way with time or moisture. Composed entirely of mineral matter, it can not decay; being of a refractory nature, it cannot burn. Insulex is not of vegetable or animal origin, consequently will not harbor or attract vermin or rodents. These advantages, together with its ease and low cost of application, make Insulex attractive. Insulex does not require any skilled labor or expensive equipment to apply. It bonds perfectly with concrete and other structural materials. It can be installed in old as well as new buildings.

When poured in place, Insulex expands and flows easily into the smallest crevices and cracks and it clings tightly to all joists and studding, thus effectively sealing the structure from heat losses through uninsulated cracks.

The advantage of using Insulex as a floor fill, to enable the architect and engineer to reduce dead load in any structure, is given by the analysis of a typical panel below:

Fs structural steel = 16,000 lb.
Fs reinforcing steel = 18,000 lb.
Fc concrete = 700 lb.

Panel 21 ft. 10 in. by 23 ft.

Concrete rib construction, 12-in. joists with 2-in. top and 3-in. concrete fill floated to finish vs. concrete rib construction with 10-in. joists (allowable because of reduced load) 2-in. top $2\frac{1}{4}$ -in. Insulex Special Floor Fill and $\frac{3}{4}$ -in. cement finish.

Concrete Fill 12-in. joists $12 \times 12 \times 5 \times 22 = 110$ cu. ft.

slab $\frac{5 \times 23 \times 22}{12} = 210$ cu. ft.
320 cu. ft. = 11.85 cu. yd.

Insulex Fill 10-in. joists $\frac{12 \times 10 \times 5 \times 22}{12} = 91.6$ cu. ft.

slab $\frac{2.5 \times 23 \times 22}{12} = 105$ cu. ft. = 7.3 cu. yd.
196.6 cu. ft.

Total concrete saved 4.55 cu. yd.

Millions of Tiny Air Cells, Visible to the Eye, Make the Ideal Insulation Condition

Insulex No. 12 Application for Ceiling Insulation

Insulex Application Over Concrete or Wood Deck for Insulation or to Build Up Slopes and Saddles

Reinforcing Rods

Rods = $5/4 \times 22 \text{ ft.} = 28 \text{ ft.}$
Concrete fill = $2 \times 28 \times 2.04 \times 12 = 1370 \text{ lb.}$
Insulex fill = $28 \times (2.04 + 1.50) \times 12 = 1190 \text{ lb.}$
Total rods saved = 180 lb.

Structural Steel

$2 \times 70 \times 23$
Concrete fill = $\frac{2000}{2 \times 65 \times 23} = 1.61 \text{ tons}$
Insulex fill = $\frac{2000}{2000} = 1.49 \text{ tons}$

Total structural steel saved = .12 tons

Total saving per panel in using Insulex fill vs. concrete fill =

Cu. yd. of concrete = 4.55 cu. yd.
Pounds reinforcing rods = 180 lb.
Structural steel = .12 ton

Plus savings, made possible through a lower total design load, in columns, footings and pilings.

Tests—Insulex has been tested by the U. S. Bureau of Standards, Armour Institute and other recognized institutions. Below are given certain tests.

Standard concrete roof construction uninsulated and insulated with No. 24 Insulex with a 5-ply built-up-roofing included.

C = Conductivity air to air in B.t.u. per sq. ft. per hour per degree.

R = Thermal resistance to passage of heat per sq. ft. per hour per degree.

We submit herewith results of tests conducted on slabs of different dimensions, made from No. 24 Insulex base and mortar (1 to 3) top covering. Slab was supported on steel plate and load applied as noted to top of mortar.

No.	Slab, in.	Thickness Insulex base, in.	Thickness mortar covering, in.	Load applied	Load, lb.	Failed
1	10x10	1 1/4	3/4	2x2 roller	2180	Slab broke
2	12x12	1 1/8	3/8	2 1/2 x 2 1/4 long	1400	Slab broke
3	8x 4 1/2	1 1/4	3/4	1x1	1100	Slab broke
4	14x14	2 3/8	3/8	1x1	2300	Punched hole in mortar

The results of these tests would indicate that No. 24 Insulex has ample strength to be used as a base for floors for office buildings or hospitals when a 3/4-in. cement mortar is used for a wearing surface.

The following results were obtained from test of Insulex designated No. 24. Mixed and cast 4x4x6 in. Tested two weeks later for compression. Compression measured by travel of head.

Load, lb.		Compression		Load, lb.		Compression

Specification Data

Roof Insulation—For roof insulation on top of wood or concrete flat roofs, Insulex No. 24 is recommended. Insulex should never be applied less than 2-in. thickness; thickness to be from 2 in. to thickness as conditions require.

Preparation of the Roof—Remove all loose material and rubbish from the roof surface. All drain connections should be set to proper grade and protected so that Insulex will not flow into and clog them. No priming or mopping of the roof deck is required. Stop all openings in roof deck before pouring Insulex, to prevent loss of material.

About 3 ft. from the parapet wall on one side of the roof, lay the first screed strip of the thickness the insulation is desired—the strip to extend across the roof. Mix and pour the Insulex according to the manufacturer's instructions printed on every bag, and screed to level with a short straightedge.

After the roof is covered in this manner, allow the Insulex to dry thoroughly and apply roofing.

Floors—For insulation, sound deadening, or for floor fill between concrete slabs and finished wood floors, or between rough wood floors and finished wood floors.

Preparation of the Floor—Remove all loose material and

Pouring Insulex for Floor Fill Over Rough Wood Floor or Over Tile or Concrete Arches

No grouting necessary around pipes or conduits

Screeding Insulex Floor Fill to Receive Hard Surfaced Flooring

Screeding Insulex Floor Fill Between Sleepers to Receive Finished Wood Flooring

Note Insulex fills all voids around sleepers

rubbish from floor. Stop all openings in floor before pouring Insulex, to prevent loss of material. Set proper leveled wood sleepers to receive finished wood floors. The sleepers will act as screeding strips for the Insulex. Mix in accordance with instructions printed on every bag and pour the Insulex in place between sleepers. Immediately after pouring, strike off with a straightedge, so notched that the surface of the Insulex will be about 1/4 in. below the top of the sleepers. Continue this process until the floor is covered. Allow Insulex to dry thoroughly, then cover with one layer of waterproof paper, lapped 3 in. before laying finished floor. **Important:** The rough floor must not be waterproofed or primed.

For hard surface flooring such as cement, terrazzo, art marble, tile, etc., the foregoing specifications will apply except that no sleepers are required. The cement, terrazzo, art marble, etc., top may be laid as soon as the Insulex has properly set.

Co-operative Service

We have standard drawings and specifications for the use of Insulex printed in looseleaf pamphlet form, suitable for filing or reference. We will gladly furnish these upon application. We also have a well equipped Engineering Staff who will be glad to go into the solution of your problem if it involves insulation, radiation, sound deadening or reduction in dead load.

Thermofill— The Dry Fill Insulation

Thermofill is a "fluffy" gypsum material which gives a high degree of heat, cold and sound insulation when employed in the walls, ceilings, floors and roofs of residences, apartments and commercial buildings.

The material is light in weight; clean and easy to handle; and is packed in 50-lb. paper sacks.

Method of Installation

Ease of installation is one of the many desirable features of Thermofill, The Dry Fill Insulation, and a feature that makes the use of the material practicable in buildings already built, as well as in new construction.

Thermofill is installed simply by pouring (dry) into the space that is to be insulated. The economy of this application is at once apparent.

In residences already built, or in new residences, a large reduction of heat loss in winter and a more comfortable interior in summer can be secured by pouring Thermofill (dry) between the floor joists in the attic, directly upon the ceilings of the top floor rooms.

Pouring Thermofill (Dry) Between Floor Joists in Attic Directly Upon Ceilings of Upstairs Rooms

Reduces heat loss in winter and insures cooler room temperature in summer

Leveling Thermofill with a Board Notched at the Ends to Allow Proper Clearance at the Bottom

2 in. is the minimum thickness recommended

If the Attic Is to Be Used, Nail Sheetrock to the Rafters as Shown and Fill the Space Behind with Thermofill

Complete details for Thermofill installation in other locations sent upon request.

Advantages

Thermofill provides an extremely high degree of heat, cold and sound insulation because of the form and composition of the material. Gypsum is an excellent natural insulator and this quality is increased many fold due to the myriads of confined air cells assured by the fluffy nature of the material and the method of installation. When installed between walls and between floors and ceilings, Thermofill prevents air circulation and the resulting passage of heat and sound.

Because it is made of gypsum.

Thermofill does not burn and it thus provides valuable protection to inflammable wood framework.

Thermofill, because of its mineral nature, can not decompose and it will not harbor vermin.

Because of its low initial cost and the saving in labor due to simplicity of application, Thermofill offers the builder a most economical as well as a most effective insulator.

Covering Capacity

The covering capacity is indicated in the following table:

Position of use	Per 50-lb. bag		Per ton	
	Sq. ft. 1-in. thick	Number cu. ft.	Sq. ft. 1-in. thick	Number cu. ft.
Walls.....	25	2	1000	83
Ceilings and floors.....	30	2½	1200	110

Thermofill is made in one weight only and is packed in 50-lb. paper bags with complete directions printed on back.

ARMSTRONG'S CORKBOARD for the Insulation of Walls and Roofs of residences, apartments, commercial and industrial buildings of all types.

For Cold Storage Insulating Materials and Machinery Isolation, see pages A208-209; for Linotile and Armstrong's Cork Tile, see pages B1508-1509; for Cork Bulletin Boards, see page C3329.

Armstrong's Corkboard

The increasing costs of domestic fuel as well as the growing appreciation of the comfort of a heatproof house have given a marked impetus to the use of insulating materials in residence and apartment construction. For this purpose no better material can be obtained than Armstrong's Corkboard. It combines all the good points of other insulating materials and eliminates the faults common to most of them. It is the most efficient practical insulation known and has been the accepted standard insulating material in cold storage construction for the past twenty years or more. There is nothing new or experimental about its use.

Description—Armstrong's Corkboard is composed entirely of cork. The cork is ground up, thoroughly sifted to remove all dust, dirt and fine particles and is then compressed in metal moulds and baked. The baking process liquefies the natural gum or resin of the cork. While in a liquid state this gum permeates the whole mass, coats each of the granules with a natural moisture-proof coating and cements them tightly together into a light, strong sheet of Armstrong's Corkboard.

Advantages—To be truly satisfactory, a house insulating material must be more than just a good non-conductor of heat. It should also be:

- (1) Nonabsorbent of, and unaffected by, moisture.

Nailing Armstrong's Corkboard to Inside Face of Studs.
Plaster Is Applied Directly to the Corkboard
without the Use of Lath

- (2) A fire retardant.
- (3) Structurally strong.
- (4) Easy to handle and erect.
- (5) Adequate thickness in a single layer.

Armstrong's Corkboard meets these requirements completely. It is nonabsorbent and has no capillarity like fibrous insulating materials. It is slow burning and does not smolder or carry fire. It has structural strength and stability. It is light and clean to handle and is easily cut, sawed and nailed. Its use eliminates wood or metal lath as plaster is applied directly to its surface.

Size and Thickness—Armstrong's Corkboard is made in boards 12x32 or 36 in., and in thicknesses from 1 to 3 in. The correct thickness to use depends entirely upon the structural and climatic conditions.

Methods of Construction—The ease with which Armstrong's Corkboard can be erected is one of the chief points in its favor. It can be put up just as readily as lumber in buildings of frame construction, or erected in portland cement mortar against brick, concrete, stone or hollow tile. It provides continuous insulation that is fire-safe, verminproof and moistureproof.

The details on the following page show how Armstrong's Corkboard is applied to the various types of residence construction. Against brick and hollow tile walls the corkboard is shown erected in portland cement mortar and in frame construction it is shown nailed to the studs, 16 in. on centers. Plaster is applied directly to the corkboard in either case without the use of lath. Other types of construction not shown here can also be used.

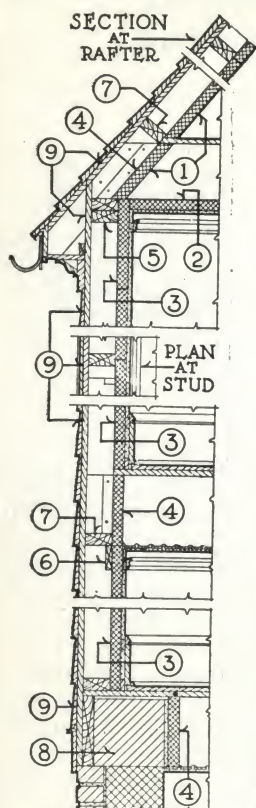

Specifications for the Insulation of Residences with Armstrong's Corkboard

Material—All insulation shall be Armstrong's Corkboard, 12 in. wide, 32 (or 36) in. long and 1½ or 2 in. thick, manufactured by ARMSTRONG CORK & INSULATION COMPANY, Pittsburgh, Pa.

Application—Masonry Walls—The inside surfaces of all walls to be insulated shall be properly cleaned and freed of loose bits of mortar, etc. Directly against these walls, Armstrong's Corkboard, 1½ in. thick, shall be erected in a ½-in. backing of portland cement mortar, mixed in the proportion of 1 part of portland cement to 2 parts of clean, sharp sand. All joints shall be made tight and vertical joints shall be broken.

Frame or Brick Veneer Walls—Armstrong's Corkboard, 1½ in. thick, shall be securely nailed to the studs with galvanized nails 2½ in. long. Nine nails shall be used for each sheet of corkboard. All joints shall be made tight and vertical joints shall be broken.

Stucco Finished Frame Walls—Armstrong's Corkboard, 1½ in. thick, shall be securely nailed to the sheathing with galvanized nails 2½ in. long. Nine nails shall be used for each sheet of corkboard. All joints shall be made tight and vertical joints shall be broken.

Corkboard Applied on Inside Face of Studs and Rafters

Frame Construction Details and Methods

- (1) Roof Insulation—*Armstrong's Corkboard* nailed to underside of rafters—plaster may be omitted in unfinished attic spaces. This insulation may be omitted if attic is unfinished and top story is insulated as at 2.
 - (2) Top Story Ceiling Insulation—*Armstrong's Corkboard* nailed to ceiling joists forming plaster base. This insulation may be omitted if roof and attic ceiling are insulated as at 1 and 10.
 - (3) Wall Insulation—*Armstrong's Corkboard* nailed to inside face of studs forming plaster base. Plaster grounds for interior wood trim are nailed through the corkboard with nails sufficiently long to penetrate 1 in. into studs.
 - (4) Corkboard cut in and fitted tight between joist and rafters to maintain continuity of insulation—vital points often neglected.
 - (5) Rafter plate.
 - (6) Ribbon.
 - (7) Fire stops.
 - (8) Masonry beam fill above basement wall—assists materially in reducing heat loss.
 - (9) Continuous sheet of waterproof building paper over sheathing, roof boarding and corkboard—prevents wind-driven air leakage. Flash thoroughly with paper around window and door openings.
 - (10) Roof Insulation—Corkboard nailed over roof boards. Tack a lath over each rafter (approximately 16 in. on centers) to the corkboard (over waterproof paper). Over the lath, nail 1x2 in. furring strips spaced to take the nails of wood shingles, slate or tile—the nails securing furring strips must be of sufficient length to pass through the lath and cork and penetrate into the roof boards 1 in. The lath prevents decay of furring strips. *This method is adapted to alteration work.* Omit roof insulation if attic is unfinished and top-story ceiling is insulated as at 2.
 - (11) Wall Insulation—*Armstrong's Corkboard* nailed over sheathing. *This method is adapted to alteration work.*
 - (12) Portland cement stucco on metal lath applied over furring. Furring strips, 1x2 in., are applied over corkboard and paper with nails sufficiently long to pass through the corkboard and penetrate the sheathing 1 in. Furring may be omitted and self-centering metal lath substituted, secured as specified for the furring strips. *Magnesite stucco may be applied directly to the corkboard surface.*
- Note: Window and door frames must be designed to fit the wall thicknesses imposed by the added thickness of the corkboard.*

Corkboard Applied on Outside Over Sheathing and Roof Boards

Masonry Construction Details and Methods

Wood Joist Construction

- (1) Roof Insulation—*Armstrong's Corkboard* nailed over roof boards. Any standard built-up roofing may be applied directly to the corkboard under the same specification as required over a concrete slab. This insulation may be omitted if top-story ceiling is insulated as at 3.
- (2) Attic or Roof Space Wall Insulation—*Armstrong's Corkboard* applied to masonry in a ½-in. backing of portland cement mortar. Required if roof is insulated—may be omitted if roof is not insulated and top-story ceiling is insulated as at 3. No plaster is required over the corkboard in unfinished portions of the building.
- (3) Top Story Ceiling Insulation—*Armstrong's Corkboard* nailed to ceiling joists forming plaster base. This insulation may be omitted if roof is insulated.
- (4) Wall Insulation—*Armstrong's Corkboard* applied to masonry in a ½-in. backing of portland cement mortar. The corkboard forms a plaster base.
- (5) Rough grounds secured to masonry with face flush with interior corkboard surface. These form nailing for plaster grounds to receive wood trim. Wood soldiers or blocks should not be built into exterior masonry walls to form nailing members. Rough grounds should be substantially and permanently secured to the masonry in any of the standard methods of attachment best adapted to the construction (expansion or toggle bolts, metal wall plugs, etc.).
- (6) Corkboard cut in and fitted tight between joists—vital points often neglected.
- (7) Roof Insulation—*Armstrong's Corkboard* applied over concrete slab in hot pitch or asphalt mopping. Finished roofing over corkboard applied as described in 1. (Corkboard may be applied in similar manner over any type of fireproof construction.)

Note: Use special care to maintain continuity of insulation at exterior window reveals and at doors.

Note: For fireproof pitched roofs covered with slate or tile, apply corkboard and roofing as at 10, assuming the same provisions for nailing of finished roofing as would exist were corkboard not installed.

Fireproof Construction

Typical Details and Methods of Installing Armstrong's Corkboard

Magnesite stucco shall be applied directly against the surface of the corkboard or portland cement stucco shall be applied over self-furring metal lath nailed through the corkboard to the sheathing.

Ceilings and Roofs—Armstrong's Corkboard, 2 in. thick, shall be securely nailed to the joists (or rafters) with galvanized nails 3 in. long. Nine nails shall be used for each sheet of corkboard. All joints shall be made tight and short joints shall be broken.

Interior Finish—The exposed surface of the corkboard shall be plastered in accordance with the plastering specification.

Samples and Literature

Samples of Armstrong's Corkboard Insulation and a filing folder, containing detailed information and complete specifications for the use of the material in residence construction, will be mailed on request.

Insulation of Roofs

Insulation of roofs of office, commercial and industrial buildings serves several important purposes. It conserves fuel in winter heating; keeps the upper floors cooler in summer and makes them more comfortable for employees and safer for the storage of goods that might be affected by excessive heat. It prevents condensation of moisture on underside of ceilings when there is excessive humidity. In textile and paper mills and other industrial plants where goods or machines might be harmed by drip from wet ceilings, roof insulation is absolutely essential.

Advantages—On most buildings, roof insulation should be placed on top of the slab with the roofing laid directly over it. It must be firm enough to afford a substantial base so that there is no danger of the roofing being broken when walked upon. However, since there is always a chance that from some other cause a break may occur in the roofing and permit the entrance of water, a roof insulating material must be non-absorbent of moisture.

In structural strength, moisture resistance, and in heat retarding value, Armstrong's Corkboard is a most efficient insulation for building roofs, as it is for cold storage work. When laid in hot asphalt and with the surface mopped with the same material, it is so completely moistureproof that it will not be permanently

Laying 1-in. Armstrong's Corkboard on the Roof of Weave Shed, Naumkeag Steam Cotton Co., Salem, Mass.

affected by any chance leaks in the roofing. Armstrong's Corkboard is nonabsorbent and it has no capillarity. Unlike some insulating materials which are often ruined by moisture in a few months, Armstrong's Corkboard is a permanent insulation and by far the most economical.

Sizes and Thicknesses—Armstrong's Corkboard comes in sheets, 12x36 in., 1 to 6 in. thick, and is easily and quickly laid. The proper thickness for insulating against heat or cold, or to prevent condensation can be determined only by an analysis of conditions in each case, such as outside and inside temperatures, humidity, etc.

Short Specification—The roof shall be insulated with Armstrong's Corkboard of the proper thickness applied in accordance with the standard specification of ARMSTRONG CORK & INSULATION COMPANY.

Further Information—The Engineering Department of this Company has collected considerable data on the subject of roof insulation and is prepared to furnish architects and engineers with specific and reliable information. Inquiries will receive prompt attention.

Warehouse stocks at New York, Newark, Boston, Houston, Galveston, New Orleans, San Francisco, Los Angeles, Chicago, St. Louis; London, Eng., and Palafrugell, Spain

Products and Service

NOVOID CORKBOARD INSULATION for all cold rooms, refrigerators and roof insulation; NOVOID CORK COVERING for refrigerated lines, tanks and drinking water systems; RUBBERCORK, a plastic insulation for all cold fittings; NOVOID CORK TILE for floors.

In our organization are experts whose many years of experience are at your disposal in connection with any insulation problems. Complete warehouse stocks of our products are carried at convenient points throughout the country. In addition, a minimum stock of 1,000,000 board feet of Novoid Corkboard is always ready for shipment from the port of Palamos, Spain.

Novoid Corkboard

Made in Spain, home of cork, in the largest cork manufacturing plants in that country, Novoid Corkboard is a high grade product with maximum insulating value and structural qualities.

In the making of cork discs for crown caps, champagne and fine taper corks, cork lined summer helmets, cork specialties, cork paper for cigarette tips, etc., only the best grade of cork bark is used. The waste left over from their manufacture is necessarily of the finest quality, dry and clean. This cork waste is properly granulated in graduated sizes, compressed in moulds so that the granules are forced closely together, and then baked by a slow and careful process in special ovens. In the baking process their natural resin binds the cork granules into strong solid sheets having *no voids or air spaces between granules*. No foreign binder is used.

In a sheet of Novoid Corkboard the dead air spaces are confined entirely to the hermetically sealed microscopic air cells in the cork itself.

Novoid Corkboard is entirely free from hard-back and "green centers." Green or improperly baked centers are disastrous to any insulating job *after* the corkboard has been installed for some time. They cannot be detected by a surface inspection so, to guard against them, Novoid Corkboard is baked in special moulds 25x37 inches in size. After removing it from the mould, each sheet is split and then finished full standard 12x36 inches. As a result the center of each sheet is open to inspection by the purchaser and its high quality verified *before* it is installed. Corners and edges are cut true and square, insuring tight joints and reducing to a minimum the labor of erection.

NOVOID CORKBOARD

Thickness, in.	*Number of sheets	Bd. ft.	Bd. ft.	Cu. ft.	Gross wgt., lb.

3	8	24	72	6.37	65
4	6	18	72	6.37	65

*Sheets are full standard 12x36 in.

Novoid Corkboard Roof Insulation

Used on roofs, Novoid Corkboard prevents the transmission of heat, making a building warmer in winter and cooler in summer, saving fuel and adding to the comfort of the occupants of the building. Standard roofings can be applied directly over Novoid Corkboard. It is proof against moisture and will retard fire. It can be laid on any kind of roof, old or new.

Novoid Cork Pipe Covering

A companion product to Novoid Corkboard. Made in three standard thicknesses: Heavy Brine, for temperatures below 0° F.; Brine, for temperatures from 0° F. to 25° F.; Ice Water, for temperatures above 25° F.

Novoid Cork Pipe Covering has many uses—for covering all brine and ammonia lines wherever used and for insulating the ice water lines of refrigerated drinking water systems in hotels, office buildings and factories. For covering tanks we recommend the use of Novoid Cork Lagging.

For covering all lines and fittings Novoid Cork Fitting Jackets are used.

These cork jackets are *moulded to fit* closely so that no air spaces will be left between the pipe and the insulation.

Rubbercork

A plastic insulation for covering all cold fittings. Can be used with Novoid Cork Covering in place of cork fitting jackets. Its use saves time and money on insulating jobs because no time is lost when changes in the plans make new fittings necessary. Can be used to replace damaged or broken fitting covers on existing lines.

Novoid Cork Tile

Novoid Cork Tile has many properties which recommend it as a flooring material. It is a non-conductor of heat, which means it is a warm floor. It wears well, giving years of service under unusually severe conditions, as in libraries or restaurants.

Novoid Cork Tile comes in three shades of brown and in several standard and special sizes. They can be harmoniously blended into an unlimited number of beautiful patterns, each attractive and pleasing.

A Novoid Cork Tile floor is an easy floor to walk on because of the natural resiliency of the cork. Quickly and easily laid. Easy to clean and keep looking new.

"Everything Made of Cork."

Pure Baked Cork Board**For Cold Storage Construction**—For packing
plants, ice plants, breweries, creameries, dairies, ice cream
factories, refrigeration, fur storage vaults and all other
requirements where maintenance of uniform tempera-
tures and conservation of refrigeration are important.**For House Insulation**—The successful use of pure
cork board for refrigeration insulation is ample proof of
perfection in insulating material. Refrigeration experi-
ence points the way to this proven insulator for the mod-
ern home.**Jointite Pure Baked Cork Board****Jointite Cork Board Meets United States Gov-
ernment Specifications**—The insulation requirements
of the United States Government are without a doubt the
most severe, as witness the following test specifications:"The weight of the cork board shall not be less than 8
pounds nor more than 12 pounds per cubic foot."Representative samples of the cork board shall be sub-
merged in boiling water at atmospheric pressure for three hours
without disintegrating. Immediately upon removal from the
boiling water the samples shall be measured for linear expansion
which shall not exceed two per cent in any direction."To this rigorous test requirement, Jointite Cork
Board conforms in every particular.**Pure Cork Sectional Pipe Covering and
Moulded Cork Fitting Covers**For ammonia, cold water, ice water, brine
and special cold lines.Pure cork covering is the only thoroughly satisfac-
tory covering for cold pipes of all kinds. Jointite cork
covering and Jointite moulded fitting covers are made
from pure granulated cork, compressed and moulded
to fit various sizes of pipe and fittings in ordi-
nary use.**Pure Cork Sectional Pipe Covering****Moulded Cork Fitting Covers**They are coated with Jointite mineral rubber compound,
ironed on at the factory. And, being applied to the
lines with waterproof cement on the joints, they
produce a positive Jointite insulation not affected by
moisture.Jointite pipe coverings and moulded covers for fit-
tings possess maximum insulating efficiency, durability,
neat appearance and ease of application.**Suggested Thickness for Sectional Pipe Cover-
ing and Moulded Fitting Covers—**

- (1) Approximately 1½-inch thickness for ice-water and
cold lines where temperature of 30° Fahrenheit and higher are
carried.
- (2) Standard brine covering, from 2 to 3-inch thickness, is
designed for ammonia and brine lines where temperature ranges
from 0° to 30° Fahrenheit.
- (3) Special thick covering from 3 to 4-inch thickness for
temperature below 0° Fahrenheit.

Mundet ServiceSatisfaction is a big word with a big meaning. To
our customers, both prospective and actual, we give an all
inclusive service which combines quality products, engi-
neering knowledge and construction skill.The construction department maintained by us is in
keeping with our high quality product. All insulation
work is therefore performed in the most approved and
workmanlike manner. To contractors or owners who
prefer to install the insulation themselves, we extend the
privilege of drawing on our knowledge and experience,
all in the interests of profitable insulation.Write for samples, prices, information or construc-
tion estimate to the Home Office.

Products and Service

CRESCENT 100% PURE CORKBOARD, GRANULATED and RE-GRANULATED CORK: for the insulation of cold storage and freezing rooms, tanks, roofs, residences, etc., also for soundproofing.

CRESCENT MACHINERY ISOLATION CORKBOARD, for eliminating vibrations and reducing noise of machinery.

CRESCENT CORK COVERING, for brine or ammonia pipe lines, ice or cold water lines, and special cold lines.

CRESCENT CORK LAGGING for cylindrical tanks. Designing, furnishing and installing cork insulation and isolation is our specialty. We have a staff of expert engineers and field erectors at every one of our sales offices.

For Cork Brick and Tile, and Cork Bulletin Boards, see page B1530.

Catalogues, Samples and Service

Catalogues and samples of any of our materials will gladly be sent on request to any one interested.

Branch offices in principal cities assure satisfactory service in the installation of any of our products.

Crescent 100% Pure Corkboard Insulation

Crescent Corkboard is 100% pure, screened, granulated cork compressed into moulds to the thickness desired and then baked for several hours at a moderate temperature. This process liquefies the natural waterproof gum of the cork, which acts as a binder and protects the cork from moisture. No other binder is used.

The heat conductivity of Crescent 100% Pure Corkboard averages 7 B.t.u. per sq. ft. per degree difference in temperature per 24 hours per inch thickness.

Crescent 100% Pure Corkboard is adaptable to all kinds of construction. It has great structural strength and makes a permanent insulator. It is impervious to moisture, will not warp, rot, mold or deteriorate in any way. Tested and officially approved by the National Board of Fire Underwriters.

Size of boards 12x36 in. from 1 to 4 in. thick. Weight .75 lb. per ft. board measure.

Send for our General Catalogue "Facts and Figures on Insulation."

Roof Insulation

The elimination of heat loss through roofs as well as the prevention of condensation on the underside of roof slabs is of utmost importance in practically every building erected. The roof of every office, commercial or industrial building should be insulated. The use of Crescent 100% Pure Corkboard for this purpose conserves fuel by eliminating heat loss; keeps the upper floors cooler in summer by preventing the penetration of the sun's intense heat; eliminates condensation of moisture on the underside of ceilings in plants when there is excessive humidity.

The proper thickness of corkboard to be used for the prevention of heat loss or the elimination of condensation can be determined only by an analysis of conditions in each case, such as inside and outside temperature, humidity, etc. The Engineering Department of the Company will gladly co-operate with architects and engineers in designing roof insulation to meet specific requirements. Inquiries will receive prompt attention.

Natural Granulated Cork

Natural granulated cork is furnished in two sizes, known as 8/20 C. S. and 12/20 C. S., meaning that they are sifted through screens of 8 or 12 meshes and over screens of 20 meshes to the inch.

Natural granulated cork is a superior filling because the cork is odorless, non absorbent, does not support combustion, is not subject to decay and has a very low heat conductivity.

Re-granulated Cork

This is a by-product obtained in the manufacture of corkboard. It is more waterproof and its insulation value is higher than that of granulated natural cork.

The grades generally used are known as "Fine," from dust up to $\frac{3}{8}$ -in. granules; "Coarse," from $\frac{1}{8}$ to $\frac{5}{8}$ -in. granules; and "Mixed," a combination of both. For general use the Fine or Mixed is recommended, but where dust would prove objectionable the Coarse is preferable.

It is mostly used for filling around tanks or where cork in board form would be unsuitable.

APPROXIMATE WEIGHT PER CUBIC FOOT OF GRANULATED AND RE-GRANULATED CORK

GRANULATED CORK		RE-GRANULATED CORK	
8/20 C.S. 13 lb.	12/20 C.S. 15 lb.	Fine and Mixed 7 lb.	Coarse 6½ lb.

Crescent Machinery Isolation Corkboard

Every moving piece of machinery sets up vibrations. In the average manufacturing plant it is also the principal source of noise. Vibrations and noise have proved to be a direct cause of fatigue, accidents, and carelessness. They diminish the efficiency and output of employees. Vibrations and noise should be eliminated whenever possible.

Pumps, fans, compressors, generators, motors, steam hammers, lathes, presses, etc., produce vibration noises that are transmitted to and frequently amplified by the foundations or floors upon which machines stand. They should be isolated from foundation or floor with a material capable of absorbing their vibrations.

Typical Machinery Isolation Installation

Crescent Machinery Isolation Corkboard, because of its natural elasticity and vibration absorption qualities, is the logical material for this purpose. Similar to Crescent 100% Pure Corkboard but more densely compressed, it consists of thousands of granules of cork. Each granule is a mass of small, sealed cells containing trapped air. Hence these sheets of Isolation Corkboard form a large air cushion that absorbs and breaks up the vibrations of the machines placed upon it. The structure of this material is very strong, and will support exceptionally heavy loads with negligible compression. It is moistureproof, easily installed and reasonable in price.

Crescent Cork Covering

Crescent Cork Covering is a most efficient and economical insulation for brine lines, ammonia lines, ice or cold water lines, and special cold lines of every kind. It is manufactured of pure, clean, granulated cork, compressed and moulded in sectional forms to fit the various sizes of pipe. The fitting covers are moulded to conform to the shape and size of the various fittings in ordinary use. It is finished with a coating of mineral rubber that provides a waterproof covering for all lines and fittings. The insulation is applied with waterproof cement on all joints, which further assures covering that is impervious to moisture.

Crescent Cork Covering Provides—(1) Maximum insulating efficiency. (2) Permanent and durable insulation. (3) Neat, clean and sanitary covering. (4) A saving of at least 80% of the refrigeration lost from bare pipes. (5) An easily applied covering at a moderate cost.

Thicknesses—Standard Brine thicknesses: 2 to 3 in. thick. Designed for brine and ammonia gas lines, and for lines where the refrigerant temperature ranges from 0° F. to 25° F.

Ice Water thickness: approximately 1½ in. thick. For drinking water lines, cold water lines, etc., where temperature of 25° F. and higher is carried.

Special Heavy Brine thickness: 3 to 4 in. thick. For lines where the temperature runs below 0° F.

Note: Covering of the proper thickness must be used to secure satisfactory results.

Crescent Cork Lagging for Cylindrical Tanks

Crescent Cork Lagging and Discs beveled to any desired radius without finish, coated one side, or coated both sides with mineral rubber finish, are furnished for covering cylindrical brine tanks, ammonia accumulators, ice water tanks, filters, etc.

Send for our literature giving detailed weights, list prices, etc., and for samples if desired.

Wicander's "Thrubake" Corkboard

It is especially adapted for heat and cold insulation for all temperatures below 400° F. It is a solid insulator of constant high quality; can be readily sawed and handled like wood; odorless, not hygroscopic.

Uses—Chiefly used in the construction of refrigerated rooms, ice boxes, ice cream cabinets, freezing tanks; for insulating the roofs and walls of dwellings, commercial and industrial buildings. Also suitable for soundproofing, isolating noise and vibration from motors, engines and other machinery.

Wicander Organization

Established in 1868, this company operates its own corkboard factories in Spain, Sweden and Latvia, as well as cork product factories at Stockholm, Gotenburg and Helsingborg, Sweden; Helsingfors and Abo, Finland; Seixal, Sines and Vendas Novas, Portugal; Algeciras, Spain; Djidjelli, Algier; Odessa, Russia; Warsaw, Poland; Libua, Latvia; and at Hamburg, Germany.

Large stocks for immediate delivery are carried at New York, Boston, Buffalo, Chicago, Indianapolis, St. Louis, New Orleans, Denver, Los Angeles, San Francisco and other points.

Method of Manufacture

The by-product—cork waste—obtained in the production of bottle stoppers and other cork articles is carefully ground up in small particles of about 1/4 to 1/2 in. in size. The cork granules are so cut and mixed that a minimum of void spaces is created between the granules when confined in moulds. By grinding up cork into small

The Four Thicknesses of Corkboard

sharp granules, eliminating all hard pieces, a higher insulating quality is obtained.

The cork granules are placed into steel moulds, covered by a steel plate, the mould placed under a hydraulic press, pressure applied until the layer of material is 4 in. thick when the form is locked and passed slowly through baking oven at about 550° F. This causes the evaporation of water which cork as a vegetable product contains and causes the natural sap to exude. This sap acts as a binder cementing the cork particles securely together.

After the heat has penetrated the cork slab uniformly and all excess moisture has escaped, the color all through the 4-in. slab is chocolate brown, and when the thick slab after cooling is sawed up into thinner slabs, one cannot tell which side was exposed to the heat.

Insulating Quality

The high insulating effect of baked corkboard is due to the millions of small air cells within the cork, and to the absence of moisture. Tests made at the Bureau of Standards, Washington, D. C., and partly reproduced herewith show remarkably favorable values for Wicander corkboard.

TABLE 1. INSULATING VALUE OF PURE CORKBOARD

Expressed in B.t.u. per 24 hr., per sq. ft. 1 in. thick, per deg. F., difference in temperature of faces of specimen. Tested by Hot Plate Method.

Weight, lb. per cu. ft.	Mean temperature of sample under test, deg. F.					
	104°	86°	68°	50°	32°	14°
9	7.20	7.03	6.88	6.72	6.58	6.41
7.6	6.77	6.60	6.46	6.29	6.14	5.98

Sizes and Packing Details

Wicander Corkboard is offered in dimensions of 12x36 in., either 1, 1 1/2, 2, 3 or 4 in. thick, which sizes have been used in the United States for many

Wicander Corkboard

years. To help preserve the square sawed edges, these slabs are neatly packed in cardboard containers.

In building and many other applications a larger slab is found particularly advantageous in eliminating much labor and reducing the number of joints. These slabs come in metric sizes, namely 1/2x1 metre, equivalent to 19 1/8x39 3/8 in., the thickness being 1, 1 1/2, 2, 3 and 4 in. These large metric slabs are packed in wooden crates. The complete details are given in the table below.

Engineering Service

Wicander Engineers will be glad to co-operate with architects and engineers in the solution of any problem in heat (or cold) insulation and isolation. Distributors maintaining construction crews are ready to deliver and to install corkboard at any point at lowest prices consistent with Wicander performance. Inquiries promptly attended to.

ARMSTRONG'S CORKBOARD for the insulation of cold storage, freezing and constant temperature rooms and tanks.

ARMSTRONG'S NONPAREIL CORK COVERING for brine, ammonia, refrigerated drinking water and all other low temperature pipe lines.

ARMSTRONG'S CORK MACHINERY ISOLATION for reducing the noise and vibration from fans, pumps, compressors, etc.

For House and Roof Insulation, see pages A201-203; for Linotile and Armstrong's Cork Tile, see pages B1508-1509; for Cork Bulletin Boards, see page C3329.

Armstrong's Corkboard

Armstrong's Corkboard is generally recognized as the standard insulation for cold storage and constant temperature rooms of all kinds. It is made of clean granulated cork, slightly compressed in sheets and baked in metal moulds at a moderate temperature. This process liquefies the natural waterproof gum or resin of the cork, which binds the mass firmly together and protects it against moisture.

Advantages—Containing no foreign substances and consisting only of pure cork, the heat conductivity of Armstrong's Corkboard is as low as any of the commercial insulating materials. Being cellular in structure, not fibrous, it is free from capillary attraction and will not absorb moisture. It is easy to install, and when erected properly, Armstrong's Corkboard is proof against mold, rot and vermin, and will not absorb or give off offensive odors or deteriorate in any way. Furthermore,

Erecting Armstrong's Corkboard Against Concrete Walls in Portland Cement Mortar

Armstrong's Corkboard is slow burning and does not smolder or carry fire. It has been tested and approved by the National Board of Fire Underwriters.

Armstrong's Corkboard is giving excellent satisfaction in thousands of plants employing refrigeration, situated throughout the civilized world.

Cold Storage Room Insulated with 6 in. of Armstrong's Corkboard, Fisherman's Cooperative Sales & Cold Storage Co., Detroit, Mich.

Finish—Ordinarily Armstrong's Corkboard on walls and ceilings is finished with portland cement plaster applied directly to the exposed surface, but where moisture conditions are severe, Armstrong's Mastic Finish Corkboard should be used. This is standard Armstrong's Corkboard with a 1/8-in. coating of asphalt mastic ironed on at the factory.

Catalogues and Samples—The Company publishes a number of booklets on the various applications of Armstrong's Corkboard containing complete information, specifications, etc. Any of these publications will be cheerfully supplied on request together with samples.

Armstrong's Nonpareil Cork Covering

Armstrong's Cork Covering is a most efficient, durable and economical insulation for brine, ammonia and ice water lines and for cold pipes and tanks generally. Its efficiency is due in a large measure to the peculiar characteristics of its sole ingredient, cork. Like Armstrong's Corkboard, Armstrong's Cork Covering consists of granules of pure cork compressed and baked in moulds at a moderate temperature. The natural gum of the cork, liquefied by the heat, cements the particles firmly together and coating each granule with a shellac-like film, renders it practically impervious to moisture. The covering is

Applying Armstrong's Cork Covering and Lagging at the Plant of J. Butler & Co., Long Island City, N. Y.

then coated, inside and out, with a mineral rubber finish ironed on. As a result Armstrong's Cork Covering is protected internally and externally against deterioration due to moisture absorption and the penetration of frost. When properly applied and the joints sealed with waterproof cement, Armstrong's Cork Covering will last for years—longer than the pipes in many recorded instances.

Insulating Efficiency—The insulating efficiency of Armstrong's Cork Covering is due to the thousands of tiny sealed dead air cells which make up the structure of natural cork. This cellular construction so retards the transmission of heat that Armstrong's Cork Covering effects a saving of approximately 85% of the refrigeration which would be lost from bare pipes.

Forms and Sizes—Armstrong's Cork Covering is supplied in moulded covers for practically all standard, screwed and flanged fittings and in 36-in. split sections for straight pipe runs of the sizes ordinarily used. Armstrong's Cork Covering is made in three thicknesses:

- (1) Special Thick Brine—From 3 to 4 in. in thickness for lines carrying refrigerant below 0° F.
- (2) Brine Thickness—From 2 to 3 in. in thickness for lines carrying refrigerant between 0° F. and 25° F.
- (3) Ice Water Thickness—Approximately 1½ in. in thickness for refrigerated drinking water lines and others where temperatures are above 25° F.

Armstrong's Cork Covering is also furnished in the form of lagging for the larger sizes of pipes and fittings, beveled to the proper radius; and in any thickness up to 6 in. for the insulation of tanks and other cylindrical cold surfaces.

Samples and Literature—A 48-page book, "Non-pareil Cork Covering," contains complete information and specifications of inestimable value to all users of refrigeration. A copy of this book and a sample of the covering will be sent on request without charge or obligation.

Contracting Service

With a thoroughly trained construction force, the ARMSTRONG CORK & INSULATION COMPANY is prepared to handle complete contracts of any size for the erection of its products. Branch offices will co-operate with architects and engineers in solving insulation problems, entirely without charge or obligation.

Drinking Water Systems

The refrigerated drinking water system has, in recent years, become firmly established not only as a

modern convenience, but as a requisite of economy and efficiency in mills and factories, hotels, office buildings, and other public and semipublic buildings. Such a system delivers properly cooled water in exactly the quantity required, when and where wanted. It occupies little space, saves time and money, and is clean and sanitary, eliminating the waste and mussiness of the ordinary ice water tank or the bucket-and-dipper method. In manufacturing plants, particularly, the excellent results of the refrigerated drinking water system contribute in a very positive way to improve morale and efficiency, and to reduce labor turnover and time lost by sickness.

Armstrong's Cork Covering in ice water thickness is especially adapted for the insulation of the distributing lines and apparatus. It is neat in appearance, moisture-proof and fire retardant. Its high insulating efficiency insures a minimum use of refrigeration, and its durability is a guarantee of long life in service.

Booklet—A new publication, "Refrigerated Drinking Water for Mills, Public Buildings, Hotels and Office Buildings" contains valuable data on water, power and refrigeration requirements, approximate costs, etc. A copy will gladly be mailed on request.

Drinking Water Lines Insulated with Armstrong's Cork Covering, Canvas Finish, United Drug Co., St. Louis, Mo.

Armstrong's Cork Machinery Isolation

In hotels, apartment houses, hospitals and other buildings where quiet is imperative, measures must be taken to silence the operation of fans, blowers, pumps, compressors and similar machines. Such machines are generators of noise-producing vibrations which are transmitted and frequently amplified by the foundations and floors upon which they rest. To render their operation more quiet, therefore, they should be isolated from the foundation or floor by a material capable of absorbing the vibrations produced.

Armstrong's Cork Machinery Isolation, a material made of cork granules moulded in board form under pressure and then baked, is ideally suited for this purpose. The innumerable cells of the cork composing it form a large air cushion which effectively breaks up and absorbs the greater part of the vibrations from the machine under which it is placed. Armstrong's Cork Machinery Isolation is structurally strong and does not settle or harden but retains its elasticity indefinitely. It is impervious to moisture, easy to install and reasonable in price.

Bulletin—A bulletin giving detailed information about this material, including compression tests, methods of application, etc., will be mailed on request.

THE PHILIP CAREY COMPANY

Manufacturers of Heat Insulation

LOCKLAND, CINCINNATI, OHIO

BRANCHES AND DISTRIBUTORS IN PRINCIPAL CITIES

FACTORIES: LOCKLAND, OHIO, AND PLYMOUTH MEETING, PA.

Products

PIPE COVERINGS and INSULATION.

Also Insulating and Refractory Cements, and Miscellaneous Asbestos Products of all kinds.

For Waterproofing and Dampproofing Materials, see pages A56-57; for Built-up Roofing, see pages A400-403; for Asbestos Shingles, see page A415; for Asphalt Shingles, see page A421; for Flooring, see page B1537.

Carey Carocel Covering (Heating Systems)

Consists of alternate layers of fine corrugated and flat sheets of asbestos paper. Furnished in standard 36-in. long sections, canvas jacketed with bands for applying for all pipe sizes. Specifically designed to give maximum insulating value on low and medium temperature steam pipes. Better adapted than any other type of covering for temperatures ranging from hot water up to 35 lb. steam pressure.

This covering is very firm with smooth cylindrical surface, making it very desirable for exposed heating system pipes. It has 8 layers of corrugations per inch of thickness.

Technical Bulletin No. 102, furnished on request, shows comparative heat insulation values of Carocel and other insulations.

Carey 85% Magnesite Covering (High Pressure Steam)

Consists of, approximately, 85% basis hydrated carbonate of magnesite and, approximately, 15% asbestos fiber. Furnished in sections 3 ft. long, canvas covered, with metal bands, for sizes up to and including 10 in.; for larger sizes, segmental blocks are furnished. It is particularly adapted for use on high pressure steam pipes.

Standard size of blocks, 6x36 in.; thickness 7/8 to 4 in., inclusive.

Technical Bulletin No. 104, furnished on request, contains full data on heat transmission and efficiencies of Carey 85% Magnesite Pipe Covering in various thicknesses and for various pipe sizes.

Carey Impervo Covering (To Prevent Sweating)

Composed of layers of high grade insulating felt and constructed in 2 layers, each layer having a lining of waterproof felt and a jacket of waterproof felt.

Furnished in standard sections 36 in. long, finished with canvas jacket and bands for applying for all pipe sizes. Specifically designed for use on cold water and ice water lines to prevent sweating and to maintain the low temperature of the liquid. It should always be applied in double layers to break all seams and joints to prevent air reaching the pipe.

Carey Protecto Covering (To Prevent Freezing)

Consists of an inner layer of hair felt and an outer layer of wool felt.

Furnished in sections 36 in. long, finished with canvas jacket with bands for applying for all pipe sizes.

The insulating properties of these materials are well known and Protecto furnishes a combination resulting in high insulating value and neat appearance which is so often lacking when hair felt only is used.

Specifically designed to protect cold water and compressed air pipes from freezing.

Specifications for Insulating Power Plants

Boilers—Cover all exposed boiler tops, combustion chambers and drums with Carey 85% Magnesite Blocks 2 in. thick, firmly wired on and finished with a 1/2-in. coat of Carey No. 100 Hard Finish Asbestos Cement, troweled smooth.

On connections from boiler to smokestack, apply V-rib

Note: In these tables, coal has been figured at \$4.00 per ton of 2000 lb.; 13,000 B.t.u. per lb. of coal; labor, boiler room expense, etc., taken at \$1.00 per ton, making total value of coal fired at \$5.00 per ton. Boiler efficiency taken at 70%. Air temperature 70° F. Experimental data obtained at the Mellon Institute.

expanded metal lath to provide an air space of, approximately, $\frac{3}{4}$ in. Then apply Carey 85% Magnesia Blocks, 2 in. thick firmly laced in place and covered with hexagonal wire mesh, stretched tight and finished with a $\frac{1}{2}$ -in. coat of Carey No. 100 Hard Finish Asbestos Cement.

Apply a thin coating of Carey B. T. U. Cement over entire exposed brick boiler wall surface. Use from 45 to 50 lb. of cement per 100 sq. ft. of surface. Then apply a 2-in. coat of Carey 85% Magnesia Cement reinforced with wire mesh fastened to brickwork and finish with a coat of Carey No. 100 Hard Finish Asbestos Cement.

High Pressure Steam Piping—Cover all high pressure saturated steam pipes, 4-in. diam. and larger, with double standard thick 85% Magnesia Pipe Covering. Cover all high pressure steam pipes under 4-in. diam. and all high pressure drip pipes with 2-in. Carey 85% Magnesia Pipe Covering.

For superheated steam pipes use combination of the first layer Carey Hi-Temp Covering and outer layer Carey 85% Magnesia Covering as recommended in detail in Bulletin 101—High Temperature Heat Insulation.

Exhaust Steam Piping—Cover all exhaust pipes and mains within buildings with 1 layer of $1\frac{1}{2}$ -in. Carocel Asbestos Sectional Pipe Covering.

Feed Water Piping—Cover all feed water pipes with 1 layer of 1-in. Carocel Asbestos Sectional Pipe Covering.

Fittings—Cover all high pressure and exhaust steam fittings, valves and flanges with Carey 85% Magnesia Blocks and 85% Magnesia Cement, or all 85% Magnesia Cement, to a thickness corresponding to covering on adjacent pipe. Trowel smooth and finish with canvas jacket pasted on.

Finish—Over all pipe covering, apply a 16-lb. asbestos paper and an extra 8-oz. canvas jacket, tightly stretched and sewed on, approximately, 3 stitches to the inch. All canvas surfaces are to be sized and finished with 2 coats of lead and oil paint of color to be selected by architect.

Heaters, Receivers, Tanks, Traps, etc.—Cover all such appurtenances with Carey 85% Magnesia Blocks and Carey No. 100 Hard Finish Asbestos Cement to a minimum thickness of $1\frac{1}{2}$ in., or with 1-in. Carocel Blocks and $\frac{1}{2}$ -in. Carey No. 100 Hard Finish Asbestos Cement. Wire blocks securely in place, cover with 2-in. hexagonal

wire mesh, stretched tight, and apply Carey No. 100 Hard Finish Asbestos Cement, troweled smooth.

Finish with canvas jacket smoothly pasted on. Canvas jacket shall be of same weight as used on 85% Magnesia Pipe Coverings.

Specifications for Insulating Heating Systems

Boilers, Heaters, etc.—Cover all such appurtenances with Carey 85% Magnesia Blocks and Carey No. 100 Hard Finish Asbestos Cement to a minimum thickness of $1\frac{1}{2}$ in., or with 1-in. thick Carocel Blocks and $\frac{1}{2}$ in. thickness of Carey No. 100 Hard Finish Asbestos Cement. Wire blocks securely in place, cover with 2-in. hexagonal wire mesh, stretched tight, and finish with Carey No. 100 Hard Finish Asbestos Cement, troweled smooth.

Heating Pipes—Cover all mains, risers and returns (except horizontal radiator connections) with 1-in. thick Carocel Asbestos Sectional Pipe Covering.

Fittings—Cover all fittings and valves (except radiator valves) with asbestos cement approximately 1 in. thick, troweled smooth, and finish with canvas jacket smoothly pasted on. The canvas shall be the same weight as that used on the pipe covering.

Finish—All exposed canvas jackets shall be sized and painted with 2 coats of lead and oil paint of color selected by the architect. Pipe covering bands shall be applied on 18-in. centers.

Specifications for Insulating Plumbing Systems

Hot Water Piping—Cover all hot water mains and piping with Carocel Asbestos Sectional Pipe Covering 1 in. thick.

Cold Water Piping—Cover all cold water pipes within buildings, whether exposed or concealed, with Impervo Pipe Covering, in 2 layers, applied by the broken joint method, each layer being $\frac{1}{2}$ in. thick. Cover all cold water pipes in entrances, areaways, unheated rooms or otherwise exposed to freezing, with Protecto Pipe Covering 1 in. thick.

Ice Water Piping—Cover all ice water pipes, whether exposed or concealed, with Impervo Pipe Covering, in 2 layers, applied by the broken joint method, each layer being $\frac{3}{4}$ in. thick.

Finish—Same as for heating system.

Method of Insulating Boilers, Heaters, Tanks, etc.

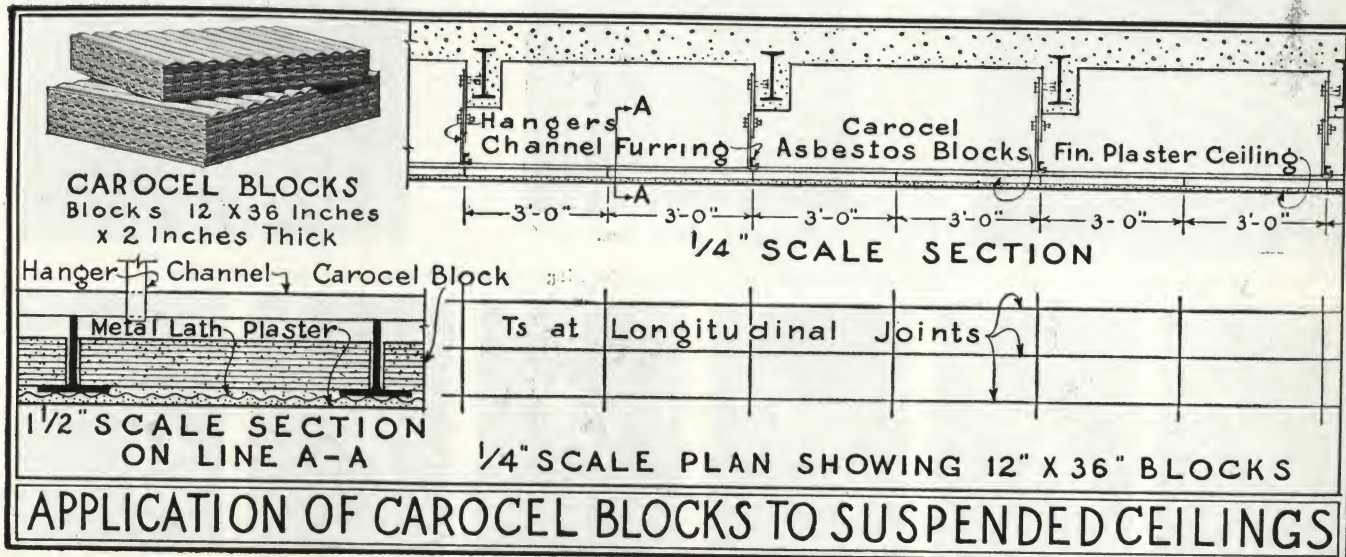

Method of Insulating Boiler Tops, Ends and Walls

Method of Insulating Fittings, Flanges, etc.

Methods of Insulating Boiler Breechings

ESTABLISHED 1910

THE RIC-WIL COMPANY

Underground Conduit Systems for Heating Pipes

Union Trust Building, CLEVELAND, OHIO

AGENTS IN PRINCIPAL CITIES

Products

RIC-WIL INTERLOCKING CONDUIT, INTERLOCKING BASE DRAIN, PIPE SUPPORTS and RIC-WIL UNDERGROUND PIPE COVERING used in the "RIC-WIL METHOD" of Insulating Underground Steam, Hot Water and Fuel Oil Pipes.

Ric-wiL Interlocking Conduit

Ric-wiL Conduit is first quality, standard weight, vitrified salt glazed tile of the bell and spigot type.

It is shipped on the job in full round sections and split into top and bottom halves as used. When installed, bell and special Loc-liP side joints are sealed with portland cement. Loc-liP joint (see illustrations below) is shaped so that cement locks top and bottom halves permanently together in all directions, giving conduit extraordinary rigidity and strength. Leakage is practically impossible. Top and bottom halves are interchangeable (foolproof) and numbered in pairs so that companion pieces may be kept together.

Sections are all in 2-ft. lengths, sizes from 4 to 24-in. inside diameter. Every sixth section of conduit has an opening in the bottom half through which a pipe support of the roller type projects to carry the steam, hot water or oil pipes, thus making the pipe supports independent of the conduit itself, a desirable feature for this class of work.

Ric-wiL Interlocking Base Drain

Ric-wiL Base Drain is first quality vitrified salt glazed tile of such design that it is both a base for supporting and lining up the conduit and drain for carrying away any water which might otherwise accumulate around the conduit. The base drain also provides two points of support for conduit, adding 35% to the ground load which the conduit will carry safely, as compared to the same conduit placed on flat ground or broken stone.

The top of the base drain has a slot in it into which the bell of conduit fits, making sections of conduit and base drain stagger with each other so that a strong interlocking construction results.

No concrete foundation is necessary in solid ground. Free drainage area of the base drain is large and ample for every practical condition. Three sizes are made: No. 1 for 4 and 6-in. conduit, No. 2 for 8 to 15-in. conduit, inclusive, and No. 3 for larger sizes. We will furnish ordinary drain tile instead of base drain, if desired, but the base drain will save more than its extra cost in labor, and makes a far better job.

Ric-wiL Pipe Supports

The pipe supports are planned to carry from one to five or more pipes and are ordinarily spaced 12 ft. apart. They are strong, made of cast iron, rustproofed, and interlock with the base drain, imposing no load on the conduit itself. Once in place, no movement of the pipes can disturb them.

Ric-wiL Conduit Systems for All Uses

Ric-wiL Conduit for underground pipe is of four types to meet varying service requirements.

Type SPC System—For steam heating and power pipes and for superheated steam. The tile itself is not lined with insulation as in Types DA and DF but the insulation is applied to pipes direct and consists of any standard make of sectional pipe covering, the kind and thickness depending upon the service to be rendered. Double drainage is provided in this type.

Type F System—For steam heating and power pipes. A lower priced type than the others, consisting of unlined Ric-wiL conduit with filler packed around the pipes. Filler is the same as described in Type DF System. Special water-proof filler can be furnished when specified.

Type DA System—For hot water, oil transmission and condensation returns. Tile and insulation in one, the latter moulded inside the tile and keyed in. Consists of a diatomaceous earth (Sil-O-Cel) mixture, light in weight and of high insulating quality; will not deteriorate. This type insulates the pipes from surrounding ground but not from each other, making it specially adapted to carry oil and steam pipes together for oil transmission. Exceptionally easy to install.

Type DF System—For steam heating and power pipes. This is Type DA with the addition of Ric-wiL Conduit Filler to be packed around the pipes at a density specified by the manufacturer. The filler is a good non-conductor which will not corrode the pipes nor shrink. Special water-proof filler can be furnished when specified.

Cast Iron Ric-wiL Conduit

For extra heavy duty under railroads or other places where conduit is subject to very heavy load, Ric-wiL is made of cast iron similar in design to regular tile Ric-wiL. It has the Loc-liP Joint and "interlox" with regular conduit. Special heavy duty base drain is furnished.

Engineering Service

Maintained for the convenience of customers. Inquiries answered promptly. Catalogs and special information furnished on request.

Ric-wiL Conduit Systems

Below: Step by step as Ric-wiL is installed. Note how sound engineering has made for unusual speed and economy.

and BOILER INSULATION.

AMBLER HIGH TEMPERATURE INSULA-
TION.

AMBLER SOUND ABSORBING PLASTER.
AMBLER ASBESTOS THEATER CURTAINS.
ASBESTOS AIR CELL COVERINGS and
BLOCKS.

Also manufacturers of Asbestos Textiles in variety.

"Featherweight" 85% Magnesia Coverings

"Featherweight" 85% Magnesia is the registered name of the product. It saves the most coal, because, being the lightest covering, it contains the largest percentage of air cells, making it the best non-conductor of heat and most economical 85% Magnesia covering manufactured in the United States or elsewhere.

As the original producers of 85% Magnesia pipe and boiler coverings, our long experience and our selective methods of manufacture assure both architect and engineer that when their specifications call for "Featherweight" 85% Magnesia Coverings the owner of the building for which they are specified will receive thoroughly durable coverings; most efficient as coal savers, because by their use the best results in heat conservation are obtained.

85% Magnesia coverings of our manufacture have been in service for a quarter of a century upon very high temperature superheated steam pipes and, upon removal, they show no change in the structure or character of the coverings.

We also manufacture the highest grade of air cell coverings, which are built of corrugated laminated sheets of chrysotile asbestos.

Consult our engineering departments on any insulation problem. Specifications furnished on request.

Ambler High Temperature Insulation

Ambler High Temperature Insulation has been found, through tests made at Massachusetts Institute of Technology, to have all the qualities required of an insulation for controlling the high temperature found in modern engineering practice.

Ambler Sound Absorbing Plaster

Description—This commodity combines wonderful properties of sound absorption with most meritorious structural qualities. It is sanitary, a fire-retardant, and has heat insulating qualities greater than asbestos board of equal thickness. It is furnished complete, ready for mixing with water, and is applied without special skill by the regular plastering contractor. *We claim it is the most practical plaster, for all wall and ceiling surfaces, that has been devised.*

Advantages—Ambler Sound Absorbing Plaster reduces excessive reverberation and the resulting confusion of sound in modern buildings. By its application to sufficient wall and ceiling surface, it produces those acceptable periods of reverberation productive of correct acoustical effects. A conservative value of the sound absorption of this plaster is 13 to 19%, depending upon the pitch; while the possibilities from careful mixing and application may be appreciated by recent tests made by the Massachusetts Institute of Technology, which found carefully prepared panels to have a sound absorbing value of 35%.

In addition, the finished surface in its natural color has an attractive texture, very desirable from an architectural standpoint.

Uses—Ambler Sound Absorbing Plaster is used in obtaining acceptable periods of reverberation in theaters, auditoriums, halls, churches, temples, schoolrooms, banking rooms, etc.

It is especially restful in hotels, apartments and hospitals.

It also decreases the sound intensity from a constant source in any room, particularly prevalent in offices, and reduces the fatigue caused by such noises.

Quantity Required—Ambler Sound Absorbing Plaster is applied in uniform $\frac{1}{4}$ -in. thickness. Making ample allowance for dropping, one ton will cover 80 sq. yd. The $\frac{1}{4}$ -in. coat weighs approximately 2 lb. per sq. ft. after drying.

Approved Specifications—Ambler Sound Absorbing Plaster shall be applied as a finishing coat $\frac{1}{4}$ -in. thick, on all surfaces specified and per

detailed specifications furnished by the manufacturer on request.

The sound absorbing plaster shall be applied upon a base of brown coat plaster, darbied to an even surface, so that the Ambler Sound Absorbing Plaster shall not vary materially from $\frac{1}{4}$ -in. thickness. After the plaster has been troweled to a fairly uniform surface, it shall be allowed to set until sufficiently dry and then floated, all final strokes to be in the same general direction.

All windows, skylights and other openings shall be covered during the application and drying of the Ambler Sound Absorbing Plaster, so as to insure uniform drying of the plastered surface.

Follow the directions for mixing and applying Ambler Sound Absorbing Plaster as issued by the manufacturers, KEASBEY & MATTISON COMPANY, Ambler, Pa.

Service—Write our nearest branch office or send plans, including data on interior surfaces and furnishings, and prompt analyses and recommendations for your requirements will be given. In this way correct acoustics can be pre-determined before final working drawings are completed.

Auction Room, Perishable Products Terminal,
Philadelphia, Pa.

Plastered with Ambler Sound Absorbing Plaster

Theater Curtains

Ambler Asbestos Theater Curtains are made of the highest grade asbestos cloth, specially woven for the particular requirements of strength, close texture, fire resistance, non-bagging, non-wrinkling and non-stretching. The Bureau of Standards has carried out extensive tests on fire resisting curtains and a copy of the report on that work will be furnished on request.

General Information

Herewith is presented the essential data and information about common brick which the architect or engineer should have at his command.

Common brick includes all types of burned clay or shale brick which have a natural surface, i.e., not spe-

BRICK
Forever

Building Brick Definition

Committee C-3 on brick of the American Society for Testing Materials have recently—June 1927—offered the following definition for the term "brick."

"Brick"—A structural unit formed while plastic into a rectangular prism, usually solid and $8 \times 3\frac{3}{4} \times 2\frac{1}{4}$ in. in size.

Common Brick Used in a Half Timbered House

EDSON GAGE, Architect

cially treated to produce certain surface effects. As is well known, common brick can be had in a wide variety of colors and surface textures, even in brick made in the same locality. The overburned "clinker" brick and the "culls," with both of which architects have accomplished such beautiful effects, are common brick.

Note—"The term 'brick' is understood to mean a unit of burned clay or shale. When other substances are used, such as lime and sand, cement and sand, fire clay, adobe, etc., the term 'brick' should be suitably qualified."

This definition, published as information to elicit suggestions and criticisms, agrees with that which the architectural profession has always understood and used.

Building Brick Classification

A new classification for building brick offered as tentative by Committee C-3 of the American Society for Testing Materials classifies building brick into three grades, A, B and C, depending mainly on their compressive strength.

Grade A includes those bricks having an average compressive strength (tested flatwise) of 4500 lb. per sq. in. or over; Grade B those having an average strength of 2500-4500 lb. per sq. in. and Grade C those having a compressive strength of 1250-2500 lb. Under the new specification absorption requirements are eliminated, since they do not accurately measure any desirable quality of building brick.

Strength of Solid Brick Work

A complete analysis of 454 laboratory tests of brick piers and walls made in this country from 1882 to 1926 shows that the average compressive strength of commercial brick masonry laid in cement or cement-lime mortar to be 1923 lb. per sq. in. and the average wall strength of brick masonry laid in lime mortar to be 1068 lb. per sq. in. The strength of individual brick ranged from a minimum of 1659 lb. per sq. in. to 18,337 lb. per sq. in. About 75% of all brick tested showed an average compressive strength of 3500 lb. per sq. in. or over.

The meaning of these abstract figures may be clearer if we consider them in a comparative sense. For example, most building codes require a minimum compressive strength for concrete block units of only 700 to 800 lb. per sq. in. The strength requirements for hollow tile and some other building units are slightly higher.

But the average strength of brick masonry, as developed in the tests mentioned above, is considerably higher than the strength of individual units required by most building codes. It is fair to say that there is no building material which builds into greater masonry strength than does common brick.

Strength of Brick Hollow Walls

The most comprehensive investigation on the strength of both solid and hollow walls has recently been concluded at the U. S. Bureau of Standards. Crushing tests on over 160 full-sized wall panels demonstrated quite conclusively that wall strength depends upon three principal factors—strength of individual brick, strength of the mortar and the character of workmanship.

The strength of solid walls was found to agree substantially with the average results stated above. The strength of hollow walls was found to average between 50% and 60% of the strength of solid walls of the same thickness, using the same materials and the same character of workmanship. The average of the hollow wall strengths ran from about 700 lb. per sq. in. to 1500 lb. per sq. in. for both 8 and 12-in. walls.

It would appear, therefore, that the strengths of hollow walls, as developed in this authoritative laboratory, are more than ample for any purpose for which hollow walls are recommended.

Fire Resistance of Brick Masonry

The recommendations of the National Board of Fire Underwriters, through the Underwriters' Laboratory, Inc., are as follows:

Walls (exterior and interior) and partitions built of common, hard-burned clay brick with cement or lime

and cement mortar, conforming in height, loading, and other limitations to requirements of the building code, recommended by the National Board of Fire Underwriters; of good average workmanship and quality of materials, and built according to good current practice are shown by tests conducted at the United States Bureau of Standards and at Underwriters' Laboratories, Inc., in accordance with the Standard Fire Test Specification to furnish protection against passage of flame and dangerous transmission of heat for the periods stated in the following classifications. The thickness here given as 12 in. is in some parts of the country designated as 13 in. These terms are to be considered as equivalent.

CLASSIFICATIONS

	Ratings
4-in. interior partitions. Non-bearing.....	1 hour
8-in. interior or exterior walls. Non-bearing, or bearing with incombustible structural members framed in.....	5 hours
Bearing, with combustible structural members framed in.....	2 hours
12-in. interior or exterior walls. Non-bearing or bearing. Not less than.....	9 hours
The foregoing classifications will usually be increased at least $\frac{1}{2}$ hour by the application of portland cement stucco or portland cement or gypsum plaster $\frac{3}{4}$ in. thick, to either side.	

The report of the Bureau of Standards' tests, too voluminous for inclusion here, is found in the Bureau of Standards Circular Letter No. 228. It contains much more data than given in the rating table above.

Thermal Resistance

Various authorities do not agree exactly on what is the actual resistance to heat transmission through any kind of masonry walls. The result of many investigations has shown, however, that both solid and hollow brick walls have very high thermal resistance. There is no form of construction having any higher, unless special insulation is incorporated. The heat loss from buildings through windows, doors and through the roof is at a very much higher rate than could possibly take place through brick walls. Attention to these points brings much greater returns than efforts to increase the thermal resistance of brick masonry.

Permanence

The very process of making brick produces an inherent quality of permanence. The clays and shales, which are the raw materials from which brick are made, have been purified and reduced by nature to a chemically stable compound or mixture, and the process of burning for many hours at high temperatures (about 2000° F.) produces a product which is as near indestructible as any building material can be. No building material surpasses brick in this respect.

There are no laboratory tests which can accurately measure the permanence of a building material, time alone can supply the test. Brick structures of all kinds standing in almost perfect condition after centuries of exposure are the best proof of the permanence of common brick.

The Artistry of Common Brick

The architectural profession is responsible for what might be termed the renaissance of common brick. The numerous combinations which are possible in bricks, bonds, mortar colors and patterns have been used with

advantage by architects to produce homes and other structures of singular beauty and charm.

Since common brick does come in such a variety of color tones and surface textures, these modern effects are possible. The modern trend is entirely away from the conventional geometrical aspect of the past to the more pleasing and almost animate beauties of the present.

Such modern beauty has been incorporated in some of the country's most costly and magnificent structures as well as in hundreds of modest homes.

Economical Construction

While good sound construction in solid brick walls is by no means expensive, methods of cost saving in residential construction are accomplished by the use of several practical systems of building brick hollow walls. The principal saving is in the quantity of brick required. The same exterior effects obtained with common brick by the variation of bonds, mortar joints, patterns and textures are obtained as easily with hollow as with solid wall for first class construction but hollow walls as the country's most prominent architects and is evidenced by thousands of attractive residences built within the past few years. Three methods of economical construction are briefly described herewith:

Ideal Walls—

The Ideal Wall is the general name used to describe all types of hollow walls built with standard common brick by placing some of the brick on edge. There are two general types of Ideal Walls, and only in the All-Rolok type does the exterior appearance of the Ideal Wall differ from the standard and traditional brickwork with which all architects are familiar.

Ideal Rolok-Bak Walls—This type of hollow wall is a general utility wall and may be employed not only for exposed walls but for unexposed walls and for basement construction. The exterior 4-in. thickness is of brick placed flat and the backing is laid of brick on edge. On the exterior, therefore, the brickwork has the usual appearance and may be faced in any bond desired. The wall may be 8 in. thick or in multiples of additional 4-in. thicknesses.

Ideal All-Rolok Walls—This type of hollow wall is interesting because of its low labor cost and minimum amount of material required. Its flat header courses and continuous stretcher courses are laid very rapidly. The wall may be built 8 in. thick and in multiples of 4-in. additional thicknesses.

Economy Walls—

This practical wall represents the lowest cost masonry construction. It is designed primarily for one and two-story houses. It is a 4-in. brick wall reinforced by pilasters and blanketed by back mortaring. At the right will be noted a comparison of the savings in material in each of the four types of brick wall construction now available to architects.

Common Brick Economy

Solid Brick Walls—

Nothing will ever take the place of the solid brick wall for first class construction but hollow walls as here described may be used where the solid wall has a great excess of strength. Economy in material is shown by the following comparison, taking the number of brick required for walls of a typical small house in each of the four types of construction as follows.

Solid walls of typical house require 25,130 brick.

Ideal Rolok-Bak Wall—

The use of this type of hollow wall construction represents a saving of approximately 20% in brick required as compared to solid brick walls.

Ideal Rolok-Bak walls for the same house require 20,696 brick.

Ideal Rolok-Bak Wall

Ideal All-Rolok Walls—

This type of hollow brick wall construction represents a saving of approximately 24% over solid walls.

Ideal All-Rolok walls for the same house require 17,739 brick.

Ideal All-Rolok Wall

Economy Walls—

This newly developed type of 4-in. brick wall represents a saving of approximately 41% in the amount of brick as compared to 8-in. solid walls.

Economy walls for the same house require 14,783 brick.

Economy Wall

Complete Treatise—A complete treatise containing full directions for the construction of both Ideal and Economy Walls may be obtained from the COMMON BRICK MANUFACTURERS' ASSOCIATION.

Common Brick—Whitewashed
Photo by GILLIES

Skintled Brickwork

These forms of wall surfaces are produced by setting the brick roughly at different angles, projecting and recessing them beyond the wall line, and even permitting the squeezed mortar to remain in place as it happens to overlap the surface. Although this method does not necessarily increase costs, it produces a novel and pleasing charm of surface.

Some architects elect to cover brick walls with whitewash to produce the aged or flat white surface sometimes associated with certain styles of architecture.

A book containing illustrations and architectural details of various skintled brickwork effects, with exact instructions for building may be obtained by addressing the Association.

Common Brick for Garden Walls and Walls

Common brick used in garden walls and garden walks is making for itself a most enviable reputation. Common brick has a peculiar aptitude for blending harmoniously with its surroundings, with a mellowness and a variety of colors distinctively its own.

Common brick in the garden wall or walk will successfully resist the action of the elements indefinitely. Its permanent appearance may be counted upon. Weathering does not detract from its colorings, as the colors are burned-in and fadeless.

Publications

Books of the Association, which the architect should find useful, are listed below:

The Heart of the Home—Beautifully illustrated brick fireplace designs with complete directions for proper construction. 25 cents.

Skintled Brickwork—Photos and details showing how to obtain these interesting and attractive wall surfaces. 15 cents.

Brick—How to Build and Estimate—A complete manual of brick construction including important and useful data and tables of required material quantities. 25 cents.

Mortar—All the essential information about mixing and using all kinds of mortar. Free.

Reinforced Brick Storage Structures and Silos—Full information and data on these economical brick structures including complete construction directions. 15 cents.

THE CARLYLE-LABOLD CO.

Manufacturers of Clatone Face Brick

PORTSMOUTH, OHIO

PLANTS: SCIOTOVILLE AND COAL GROVE, OHIO
(Both on Norfolk and Western Railway)

Clatone Face Brick

Clatone Face Brick in Buffs, Greys, Ironspots, Browns and Gun-metals.

Brickettes, size $8 \times 2\frac{1}{4} \times 1$ in Reds, Buffs, Greys and Ironspots.

Our Buffs are produced in our special Rough Texture and also in the Smooth. Greys and Ironspots are produced in Rough, Smooth and Matt Texture. Browns and Gun-metals are produced only in our regular texture brick.

We have a multitude of beautiful combinations of these shades which will satisfy the tastes of your most particular client.

See also our pages on Quarry Tiles.

Above: No. 500

A very uniform shade of Ivory Buff. This brick can be furnished in a very beautiful blend of Buffs, Pinks and Greys which makes a very attractive piece of brickwork. Smooth brick, the same shade as No. 500 can be furnished and is an excellent brick for both interior and exterior work.

Left: No. 90.

Smooth Manganese Grey is a very desirable brick for the larger type of construction, especially where it is desired to match or harmonize with limestone work on the building. Also produced in matt texture.

We also furnish a lighter shade of Natural Smooth Grey which can be furnished in straight or blended shades.

Below: No. 561

A beautiful blend of Light and Dark Rough Texture Ironspots. The different shades in this blend can be furnished separately. The same shades or blend of shades can also be furnished in matt and smooth texture. This brick is very desirable for most any type of exterior work.

Production Facilities

Our annual capacity of twenty-five million bricks assures you of satisfactory shipments and avoids delays in building construction. Our plants are centrally located for quick shipments to most any part of the United States and Canada east of the Rockies.

We distributed these bricks during 1926 into thirty-two states, Canada and Cuba. Authorized dealers in all principal cities. Inquiries sent direct to Portsmouth will be given immediate attention.

AMERICAN ENAMELED BRICK & TILE COMPANY

CABLE ADDRESS
"AMEREBRICK"

AGENTS IN ALL PRINCIPAL CITIES OF THE UNITED STATES AND CANADA

Products

ENAMELED and PORCELAIN BRICK:
White, Mottled and Standard Colors in
Standard Sizes and Ornamental Shapes.
(See plates.) We are the largest manu-
facturers of this commodity in North and South America.

Territory

The business operations of this firm cover North and
South America, Europe, Asia and Australia.

Personal Representatives

For the convenience of our customers in the United States
and Canada, we have, in order to keep in closer touch with
them, located representatives in all the principal cities to attend
personally to inquiries, orders and deliveries.

Dispatch of Shipments

Factory and office are in constant telephone connection
with each other, and we have a local telephone exchange con-
necting every department of the factory for quick and sys-
tematic dispatch of business.

Shipping Facilities

Our works, located but an hour's travel from the New
York Office, are situated so as to enable shipping over two of
the largest railroads—the Pennsylvania and the Central of
New Jersey, and their connecting lines. We are also situated
on tide water, so that shipments can be made by vessel for the
coastwise and export trade.

Precaution Against Delay

Every part of our factory, including machinery, has its
duplicate, which prevents any possibility of delay caused by
breakdowns; should they occur.

Capacity

Our present capacity is 12,000,000 brick per annum, which
will be increased as occasioned by the demand.

Stock

The average stock on hand at our factory is more than
2,000,000 brick, giving a large assortment for immediate
shipment.

Illustrations of Stock Designs

Much delay is saved by use of stock design of moulded
brick. In the two following pages are shown designs that we
recommend as being most satisfactory in manufacturing re-
sults. We try to keep a stock of these on hand, in standard
colors. These designs are chosen to reduce manufacturing
difficulties and delays to a minimum; to enable composite
mouldings to be made up; and to enable prompt filling of orders.

*Send for plates and actual paper reproduction depicting
decorative possibilities of enameled brick.*

Details Required for Special Arch Brickwork

When ordering special arches, please consult the accom-
panying cuts and give all necessary information as to details.
Furnish details as far as possible in advance of the time the
arches will be required. We should be allowed from 4 to 6

TRADE **AM-EN** MARK

The Last Word in Enameled Brick

weeks' time to make up arch brick to
conform with detail. We keep no arches
in stock.

We can not always guarantee uni-
formity of shade in arches as in regular
deliveries of first quality plain stock brick, therefore strongly
recommend the use of stock specials for lintels of doors and
windows. (See study of window opening on second page
following.)

Colors—In Bright Enameled or Dull Porcelain Finish

In addition to our regular white and standard colors, such
as our sage green, red brown, black, etc., we have made a
specialty of mottles in the following colors:

Gray, brown, black, mixed gray and black, which give an
excellent appearance for both interior and exterior work, hav-
ing a finish more on the type of marble than enameled brick.

If you have in mind, at any time, a particular color, shade
or finish of enameled brick for interior or exterior purposes,
advise us of your ideas and requirements and we will be
pleased to submit samples.

Uniformity of Shade of Our Product

We guarantee uniformity of shade in all first quality
deliveries to the limit of practicability. Colors and effects
giving most uniform results are, in order of uniformity, white,
mottled gray, mottled brown, mottled black, sage green and
red brown. Other colors follow in irregular positions.

We will try on orders of moderate size, or on larger orders
if ample time be given, to match in shade the moulded and
stretcher stock, but can not always guarantee to uniformly
shade shipments of specials, particularly on rush shipments.

Special Features and Advantages

In making our product we follow the English and Scotch
systems, working by the soft mud process. This is without
question the only process which insures durability and the
closest relation of bond obtainable between body and glaze.

Our brick are burnt in but one fire, thus making the chem-
ical change in the body and the glaze simultaneous.

Where manufacturers use the dry pressed process, the
brick have to be burnt first as front brick before the enamel can
be applied, and fired again for the fluxing of the glaze.

We use hard and durable glazes, not soft lead glazes fre-
quently seen on inferior grades of enameled brick and tile.

There has not been a single case during our 35 years of busi-
ness where any peeling or discoloring has been seen or reported.

This is better than any guarantee which we might be asked
to give, as it covers a distributed output of over 140,000,000
brick, located all over the United States and elsewhere and
subject to all varieties of climatic conditions.

Cleaning

Enameled brick are best cleaned with some alkaline solu-
tion, such as caustic soda or sodium carbonate. This cleans
the enamel and does not affect the cement or lime mortar.

Acids

Sulphuric, nitric, or hydrochloric acids, even in concen-
trated form, will not affect our glazes; but if used as a wash,
even when diluted, they will attack the cement or lime mortar.

The only commercial acids which will attack and destroy
our enamel are hydrofluoric and hydrofluorsilicic.

THE ATHENA GLAZED BRICK COMPANY

Manufacturers of Salt Glazed Brick

NELSONVILLE, OHIO

SALES AGENCIES IN ALL THE PRINCIPAL CITIES OF UNITED STATES AND CANADA

Products

ATHENA SALT GLAZED BRICK.
SANITARY FLOOR BRICK.

Athena Salt Glazed Brick

Size— $8 \times 2\frac{1}{4} \times 3\frac{7}{8}$ in.

Shade Numbers, etc.—Made in beautiful shades of mahogany (102), golden (104), buff (103), thoroughly vitrified and salt glazed on both faces and ends, and rich in both color and glaze.

All standard shapes carried in stock and special shapes made on order.

Uses—This product is used for facing both interior and exterior walls where a beautiful, sanitary and permanent wall is desired.

Principal Places—Schools, hospitals, gymnasiums, swimming pools, garages, office and factory buildings, prisons, power plants, acid vats, packing plants, subways, etc.

Sanitary Floor Brick

Size— $8 \times 3\frac{7}{8} \times 1\frac{1}{8}$ in. (shade 102). $8 \times 4 \times 1\frac{1}{8}$ in. (shade 103).

Uses—This product is especially desirable for use in packing house floors, and is being extensively used for this purpose. Only one side is glazed and either side may be used as desired.

General Properties of Salt Glazed Materials

All shades of standard and floor brick are burned to about 2200° F., thoroughly vitrified and salt glazed; moistureproof and acidproof; will not craze, crack or peel; withstand heavy crushing strain and always look fresh and clean.

Facilities

We have a modern, electrically equipped plant, with an annual capacity of 18,000,000, and a large and well selected stock for quick shipment. Samples and prices will be furnished by our nearest agent upon request.

THE FINZER BROS. CLAY CO.

Manufacturers of Clinton Face Brick for Interior and Exterior Use

SUGARCREEK, OHIO

THE CLAY CITY

Finzer Bros. Face Brick Colors

The regular Clinton line of face brick can be supplied in the following colors:

Clinton Colors—

Clinton Reds—Nos. 130, 140, 145 and 150.

Red Matt—Nos. 420, 430, 440 and 445.

Clinton Ivories—Nos. 220, 230 and 250.

Smooth Buff—Nos. 320 and 330.

Forestblend—No. 455.

Samples

Samples of unique textures and colors of Clinton Face Brick will be sent free of charge upon request.

Textures

Clinton Face Brick can be secured in Smooth, Matt or Rug Textures.

Specifications

To insure the use of Finzer Bros. brick insert the word "Clinton" or "Forestblend" at any place in the specifications where face brick is called for.

Special Advantages

The plant is located in Sugarcreek, Ohio, "the Clay City." The clays from this region are internationally famous for their purity and beauty. Ours is one of the few plants equipped to mix shale and fire clay thereby producing shades which can be manufactured in very few plants.

Finzer Bros.' representatives are located throughout Eastern United States and prompt shipments of any amount of brick can be made on short notice.

Shade 230 Ivories, Uniform

Shade 330 Light Ivory

Shade 390 Dark Buffs

Shade 455 B & E Mixture

Shade 455 A & D Mixture (Flemish Bond)

Shade 440 Dark Red

Shade 145 Extra Dark Red

Shade 455 Full Range

Forestblend Face Brick

Texture

Forestblend is made by special patented process and can be obtained only from the Finzer Brothers Clay Company or their representatives. This texture is something entirely new and particularly appealing to the architect. Samples will be forwarded upon request.

Colors

Forestblend may be obtained in colors listed below. There are some three to five shades of each of these major colors. Forestblend known as Shade 455 of the Clinton Face Brick line will permit the architect to effect practically any color scheme desired. That is accomplished by eliminating certain shades and substituting others. This additional service is given without extra charge by our Finzer representatives.

455A—*Browns*

Blues

455B—*Dark Tangerines*

455C—*Greens in range*

455D—*Reds and red hearts*

455E—*Light Tangerines*

Special Note

Regular carload mix consists of 35% 455A's, 20% 455B's and E's, 20% 455C's and 25% 455D's. These percentages, as stated, can be varied to suit the purchaser's requirements. We can also arrange to include a percentage of straight Red Matts known as Shade 440 or 445 in the above if a large percent of reds is desired.

Representative Installations

We would like the architect in all cases to see the beautiful effects which can be produced with Forestblend Face Brick or any of the Clinton Line. Due to the large number of buildings in Eastern and Mid-western United States which have been faced with Clinton Face Brick, it is impossible to publish a complete list in this limited space. Upon request however, we would be very glad to send to any architect a list of buildings near his office. Simply write to Finzer Brothers Clay Company, Sugarcreek, Ohio, stating the information you desire. It will be furnished promptly and no salesman will call unless you request it.

Plant Locations and Shipping Facilities

The Finzer Bros. plant is located on the Wheeling & Lake Erie Railroad, which road is able to furnish ample cars for all requirements. We have connections with New York Central, Pennsylvania, B. & O., Erie and Nickle Plate roads and all leading trunk lines of Eastern United States. The yearly capacity of our plant is 45 million bricks. Orders of any size can be taken care of promptly.

FISKE & COMPANY, INC.

Manufacturers of Face Brick and "Fisklock" Brick
Sole Manufacturers of "Tapestry" Brick
115 Federal Street, BOSTON, MASS.

BRANCH OFFICE: 17 West 46th Street, NEW YORK, N. Y.

Products

FACE BRICK: FISKE MILTON REDS, DARLINGTON GRAYS, "FISKLOCK," "TAPESTRY," "TAPESTRY" ANTIQUES, "CALEDONIAN," and other high grade Face Brick. Also Fire Brick and Brick Specialties.

Trade-Names and Patents

"Tapestry" Reg. U. S. Pat. Off.

"Fiske" Reg. U. S. Pat. Off.

"Fisklock" Reg. U. S. Pat. Off.

"Caledonian" Reg. U. S. Pat. Off.

To protect our customers against substitution of inferior products, these trade-marks are branded on our bricks.

Fiske Service

Fiske service starts with your order or even before and continues until the last brick is in the building. It is our aim to provide the architect and the owner through our great variety of textures and ranges of color with every opportunity for self-expression and to aid the builder through "Fiske Service" to carry out their ideas.

"Tapestry" Brick

It is a rough texture, end-cut face brick burned to flashed shades. The colors of "Tapestry" brick are soft and rich with almost an infinite number of shades. There is only one "Tapestry" brick; Fiske makes it.

"Tapestry" Antiques

"Tapestry" Antiques are just what the name implies—old looking, irregular bricks that might have come from an old English wall. All the colors of "Tapestry" burned to deeper shades are available in "Tapestry" Antiques.

The New Fiske Brick

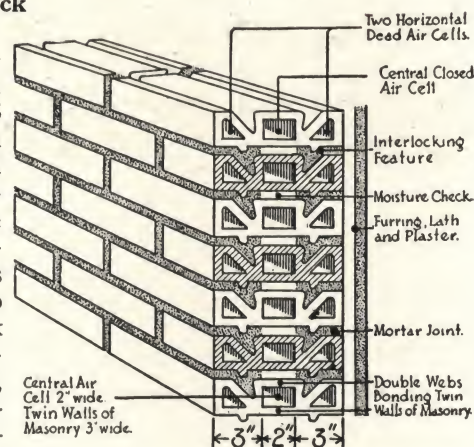

Architects who have seen this brick tell us that we have found a new color combination and prophesy a popularity equal to that of our famous "Tapestry" Brick. This new member of the Fiske line may be had in "Fisklock" as well as solid brick. It is burned to soft blending shades of browns, purples and grays. Just to see this brick brings up delightfully new possibilities in building effects.

"Fiske" Brick

A face brick with smooth face in grays and buffs, or end-cut rough texture in full range of colors and clear reds.

"Fisklock" Brick

"Fisklock" is an interlocking channel brick, 8x2 1/4 x 8 in., with rough texture and beautiful coloring. It has the face of a standard brick and is equivalent to one face brick and one common brick, forming an 8-in. wall by itself, saving labor cost of brick backing.

The multitude of horizontal dead air cells in a "Fisklock" wall make it an ideal insulator against heat or cold, while the lack of continuous mortar joints prevents moisture from striking through.

Economy—Each "Fisklock" brick is equivalent to two standard bricks, but is laid without additional effort because of the balanced handhold.

"Fisklock" saves freight and truckage costs—it weighs only seven-tenths as much as the face brick and common brick it replaces, and less mortar is required than in an equivalent wall of solid brick.

"Fisklock" in the wall is cheaper than any other form of face brick construction.

"Caledonian" Brick

A horizontal rough texture side-cut face brick burned to either clear colors or a range of shades.

"The Black Brick Building"

FISKE & COMPANY, INC., is always ready to co-operate with the architect and assist the builder. For the American Radiator Building, Fiske produced a black brick specially manufactured to meet the requirements of the architect. This structure is frequently spoken of as "The Black Brick Building."

"The Black Brick Building,"
American Radiator Company, New York, N. Y.

View of One of the New Fiske Tunnel Kilns

HANLEY COMPANY, INC.

FORMERLY BRADFORD BRICK & TILE CO.

Tunnel Kiln Face Brick

BRADFORD, PA.

NEW YORK OFFICE: 565 Fifth Avenue

PLANTS: BRADFORD, PA., SUMMERVILLE, PA.
SALES REPRESENTATIVES IN ALL PRINCIPAL CITIES

BOSTON OFFICE: 260 Tremont Street

Products

"BRADFORD FULL RANGE;" "BRADFORD REDS;" "SUMMER GREYS;" "SUMMER BUFFS;" COURT BRICK; IMPORTED FACE BRICK; RED FLOOR TILE.

Hanley Face Brick—Available in All Colors and Textures

"Bradford Reds"—(a) Even shades in a deep cherry red to a light red; available in dry press or wire cut. (b) Rich range of colors including greens, browns, tans, blues and reds.

"Summer Buffs and Greys" and Hanley Whites, Browns, Goldens, Tangerines—(a) Even shades in buff, grey, white, cream, brown, tangerine and golden. (b) Blends of practically any percentage of these colors which are desired to fit the architect's scheme for color. Available in either dry press or wire cut process.

Made in what is believed to be the largest and most modern tunnel kiln face brick plant in the world, these brick approach perfection in face brick, due to the unique process by which they are made. In the tunnel kiln process which was initiated in a practical way by the HANLEY COMPANY, INC., in 1921 and refined in 1925, brick are no longer burned in the beehive type of kiln with its large amount of manual handling and its resultant poor mechanical quality and heavy breakage.

Characteristics—Hanley Face Brick are made by a new process, introduced and developed by the HANLEY COMPANY, INC., by virtue of which colors are predetermined and mixed to suit the architect, in contrast to the old type of brick plant which obtains a standard range of colors and does not have control over the percentage of shades and colors to be included in the blend. This ability to exactly mingle colors to order is a big step forward in the color possibilities of face brick, as any color combination can be chosen to blend with the roof, trim, shutters, entrance and landscape.

Two features of Bradford Smooth Wirecut Reds which have given them a unique position in face brick construction are: (1) mechanical perfection and (2) rich cherry red color that has never been attained in any other face brick. These features have led to their usage for trim for stucco and frame houses where vivid coloring is necessary to give life to a dull wall; porch piers and steps which demand mechanical perfection, exact size and hardness as well as rich colors, in all of which Bradford Smooth Wirecut Reds are leaders.

In the Hanley tunnel kiln process brick are handled just half as many times as required by the old beehive process. A further advantage of the HANLEY COMPANY, INC., process is that brick require but five days to go through the complete manufacturing process, as against three to four weeks required by the old process.

Architects, by virtue of this process, are able to obtain service on special types of brick in one-fifth the time, and are assured of a better brick mechanically, thereby reducing laying cost in the wall. The ease of laying is further increased by the three holes in the brick, which combined with the absorption makes them an ideal brick for winter laying.

TRADE-MARK

The even shades of "Summer Buffs and Greys" are characteristic for their clear colors, due to the process of manufacture and to the fact that natural gas, a clean fuel is used. A full variety of textures is available in all types. In addition to the clean buff and grey colors, a beautiful range of brown and tan colors mingled with a grey background are available for large structures in which a range of color is desired to add life to the large wall expanse.

Court Brick

The practice of using "Court Brick" for light reflecting purposes in the tall structures being erected today, is growing with the increase in tall buildings. An additional usage for Hanley Courts is for basement interiors where, in 4-in. walls both sides of the brick are exposed.

The Hanley Court Brick deserves special mention. It is not a discolored by-product, but is guaranteed to be free from dark headers or "flashings," mechanically an excellent product, and easy to lay. Hanley "Courts" will give a light wall effect far superior to that ever before offered.

Imported Face Brick

These handmade brick have received a widespread welcome from the leading residential and apartment architects in the country. They combine the non-mechanical features of imported brick with the soft, gently blending hues of yellow, orange, tan and red. Their use has been largely in suburban work where the color blend with shrubbery is very effective.

Red Floor Tile

Flawless surface, deep rich red color and impenetrable hardness are features which make Bradford Floor Tile distinctive. Made regularly in the following sizes and weights:

3x3 in., .65 lb. each
3x6 in., 1.3 lb. each
6x6 in., 2.6 lb. each.

Territory Served

Due to the exceptionally high quality of Hanley Face Brick they are shipped to a wide territory, the Bradford Reds being sold regularly in 32 states east of the Rockies, whereas the white, grey and brown brick are distributed to an even wider territory.

Facilities

The name "Hanley" is a guarantee of the best products that 35 years' experience can produce.

Two of the most modern face brick plants in the world built on the *tunnel kiln principle*, enable us to promptly deliver red, grey and buff face brick in any quantity and in a number of distinctive types of smooth and rough texture.

Architects in 32 States have placed their confidence in Hanley products and have learned to depend on the character, reputation and stability of this progressive manufacturing concern.

Product

A complete line of Face Brick sold under the trade name "Greendale." Suitable for every type of construction from the simplest bungalow to the most elaborate office building or public structure.

"Greendale"

TRADE MARK

FACE BRICK

"Greendale" Blends

Pontiac Pot-Pourri—A combination of gray, brown, gun metal and red Rugs; especially appropriate for certain types of churches, apartments and residences. Illustration on opposite page.

Characteristics

"Greendales" are made from clays of unusually high and uniform quality, mined on our own properties. "Greendales" are thoroughly burned, vitrified, and retain their original beauty. Age and weathering only serve to enhance their beauty. They can be obtained in an unlimited variety of color tones ranging through various shades of red, buff, brown and gray. "Greendale" brick are assorted in uniform shades and can be blended in any percentage. The popularity of "Greendale" Brick is widely recognized because of their distinctive texture and wonderful color harmony.

"Greendale" Rug Brick

The texture of the "Greendale" Rug when laid in a wall gives the appearance of the soft and alluring color tones of a Turkish or Persian rug.

Shades—No. 72 Light Ivory; No. 74 Cream; No. 76 Light Buff; No. 78 Medium Buff; No. 80 Dark Buff with pinkish cast; No. 86 Flashed Grayish Brown; No. 88 Light Brown, tan cast; No. 90 Medium Brown; No. 92 Dark Brown; No. 94 Gun Metal.

"Greendale" Semi-Smooth

This is a new and unusual texture and is the result of much study and experiment to meet the insistent demand for a brick in the large cities which will resist the effects of smoke and dust and still produce a light wall effect. The texture is sufficiently rough so as not to give a wall the glaring effect of a smooth brick, but still removes the objection which many architects and owners feel toward the use of rough texture brick.

"Greendale" Red Rug Brick

Manufactured from selected shale and burned to a rich Burgundy Red. Manufactured for blending purposes only and not offered for sale as a straight line.

Seville—A blend of "Flashed" grayish brown shades which can be readily adapted to Spanish types of architecture. This blend produces a light wall effect yet the colors are neutral to dust and dirt. Illustration on opposite page.

561 Full Range—A blending of all clear burned Rug shades running from Light Ivory to Dark Buff. Natural Cement or Buff mortar color is very appropriate with this blend. Illustration on opposite page.

563 Full Range—A blending of all "Flashed" Rug shades running from gray to gun metal. Effective when laid in natural cement or double strength chocolate mortar with raked joints. Color card on request.

261 Full Range (Semi-Smooth)—Is furnished in the same range of color as the 561 Full Range. (See color illustration opposite page.) However, this color range can be modified by leaving out the lighter or darker shades so as to give a more uniform effect.

262 (Semi-Smooth)—Is a blend of gray and grayish brown similar to the Seville blend. See illustration opposite page.

Plant and Facilities

"Greendale" Face Brick is manufactured at Greendale, Ohio, in one of the largest individual plants in the country. The tract consists of about 2200 acres containing deposits of rich clay ideally adapted to the manufacture of superior face brick. A tunnel kiln recently completed gives a capacity of about 32,500,000 bricks annually. Large production and central location insure prompt and efficient service.

Information

"Greendale" distributors will be found in the principal cities where displays of brick may be seen and literature obtained. Samples are also on display at the Architects Samples Corporation, New York City. Inquiries addressed to our general offices at Logan, Ohio, will receive immediate attention. Samples and color cards on request.

"Greendale" 561 Full Range

A wall of this shade is a study in masonry with every harsh feature common to other light brick eliminated.
The same colors are produced in Semi-Smooth texture.

"Greendale" Seville

A blend of flashed, grayish brown shades, especially adapted to Spanish types of architecture.
The same colors are produced in Semi-Smooth texture.

"Greendale" Pontiac Pot-Pourri

The soft, mellow color tones of Pontiac Pot-Pourri give to the building a quiet elegance and refinement.

The HY-TEX BRICK line embraces: Face Brick, Enamel Brick, Salt Glaze Brick, Equitable Brick, Paving Brick, Common Brick and Hollow Building Tile.

Hy-tex Brick

The Standard of Quality in Brick
TRADE-MARK

They have been used in many large buildings with complete satisfaction.

Hy-tex Salt Glaze Brick—Hy-tex Salt Glaze Brick, ranging from light straw to a golden brown,

as illustrated on next page, permits walls of light, medium, dark or mingled shades. The salt glaze which forms an integral part of the brick, will not scale or peel under the most severe conditions, and is proof against moisture, dust, smoke, stains, germs, and even acids. They are widely used as exterior brick in the business, wholesale and industrial sections of cities, and for interior uses where light reflection and bright, clean, sanitary surfaces are desired or necessary, as in corridors, stairways, vestibules, wainscots, light courts, gymnasiums, toilet rooms, engine rooms, food factories, garages, etc. The cost of Hy-tex Salt Glaze Brick closely approximates that of plastered and painted common brick, while its maintenance cost is less.

Hy-tex Equitables—This brick was originally created for the *Equitable Building* in New York City, and has since been available in white and grays in various speckled effects. They present a smooth impervious surface and wash with the rain to their original clean appearance; and do not craze, scale or discolor under the severest climatic conditions. Suitable for both exterior and interior requirements.

Hy-tex Face Brick

The Hy-tex color range runs in face brick from the lightest colored creams, grays and buffs to the darkest reds and browns in smooth, semi-smooth and rough textures. It offers literally hundreds of various tones in the gray, buff and red basal colors. No matter what your requirements, whether for exterior or interior use, you will find in the Hy-tex line just the brick you want.

Specialties

Hy-tex Enamel Brick—Hy-tex Enamel Brick are unapproached in quality and durability by any similar brick of domestic or foreign manufacture. The "double-burn" process, an improvement over European methods, used exclusively in manufacturing Hy-tex Enamel Brick, eliminates the uncertainties present where the enamel is spread on the green brick and both are burned together with practically no control over varying fusion points, unequal expansion and impurities burning out as bubbles in the glaze.

Hy-tex Enamel Brick in the white and ivory shades are absolutely opaque. Hy-tex Enamels will not craze, peel or discolor under the severest climatic tests, as proved by the experience of exacting architects in all parts of the country. They are made in white, ivory, green, brown, blue, jade, black, transparent speckled buff, transparent speckled brown, and are used extensively for facing large office buildings, theaters, stores, etc., as well as for hospitals, corridors, schools, gymnasiums, laundries, restaurants, bake ovens, garages, engine rooms, outdoor and indoor swimming pools, etc.

Hy-tex Enamel Court Brick are in every way the same brick, as to make and durability, as Hy-tex Enamels, except that, in sorting for first quality, these have been set aside because of slight surface defects which are not noticeable in courts or areas. Unless closely examined, they make the same appearance as Hy-tex Enamels and render exactly the same service.

Facilities

For over half a century the HYDRAULIC-PRESS BRICK COMPANY has been building the reputation which Hy-tex products enjoy today. During that time the Hy-tex organization has grown from one to twenty-two plants, scattered through the eight great clay-producing states. Branch office and agency distribution insures prompt and efficient service in all parts of the country.

Literature

This company has issued booklets on Hy-tex Brick, Salt Glaze Brick, Hy-tex Enamel Brick and Equitable Brick; Brick Scales and Tables, a ready and convenient method of determining the number of courses and joints in all brickwork; Color Cards, and other material. For any of the above, apply to nearest branch office.

Basic Shapes in Hy-tex Enamel Brick

The enameled surfaces and shapes shown here, together with the stretcher shown in the color group, form the seven basic shapes in Hy-tex Enamel Brick. The series is completed by furnishing for the plane surfaces the stretcher and flatter, the quoins, headers, and the over- and under-dipping of the abutting surfaces—either wholly or in part.

For the moulded shapes, in addition to this over-

and under-dipping which may be necessary to cover conditions arising in use, there are provided the complementary brick essential to their general use. These are headers, internal and external angle brick, returns and stops.

For detailed information, showing the various brick and combinations thereof, refer to shape book issued by this company.

THE METROPOLITAN PAVING BRICK CO.

Manufacturers of "Metro" Face Brick, Paving Brick and Hollow Tile
CANTON, OHIO

SEVEN PLANTS—CANTON, O.; MINERVA, O.; BESSEMER, PA.

Representatives in Principal Cities

Products

"METRO" FACE BRICK

"Metro" Paving Brick and Hollow Tile.

"Metro" Vitrified Floor System for
Trickling Filters.

Samples

Samples of "Metro" products gladly
furnished on request.

"Metro Taverns" No. 1 Blend

These brick are semi-smooth and impervious. The color in this brick made it popular for large operations for fine tone effects. No glaze and remains clean.

"Metro Taverns" No. 2 Blend

When a mingled effect is required in a semi-smooth impervious brick, we offer the above. Suitable for Dutch Colonial, English and Colonial types.

"Metro Taverns" No. 3 Blend

Soft pastel shades produced on these semi-smooth brick give them a distinct Architectural appeal.

"Metro-English Art"

Delightful rough wall effects are obtainable with this brick. The undulating lines together with the light and shadow effects, produce a wall full of life and movement that is so desirable for exclusive work. Roughness or color as desired.

Full Range "Metro Mat-Tex." Shades Nos. 130-F to 180-F

We guarantee to ship any shade, percentage or mixture selected from the above, to produce any Architectural effects. Percentages can be varied, shades eliminated, at your discretion.

The Metropolitan Paving Brick Co.

"Metro" Ver-Tex—Shade 40-F.

When a straight shade vertically-scored brick is desired, the bright red of this brick is most distinctive.

"Metro" Smooth Colonial Full Range Mingle—Shades No. 230-F to 280-F

These brick are particularly adaptable to produce English or Colonial effects. The markings, and blend of color, give the weathered effect so desirable on this type of work.

"Metro" Mat-Tex Full Range Mingle—Shades No. 130-F to 180-F

We guarantee to ship any shade, percentage or mixture selected from the above, to produce any architectural effects. Percentages can be varied, shades eliminated, at your discretion.

THE MEDAL BRICK & TILE CO.

Manufacturers of Face Brick and Tile

MAIN OFFICE

4900 Euclid Avenue
CLEVELAND, OHIO

PLANTS AT WOOSTER, MALVERN AND CARROLTON, OHIO
DEALERS IN ALL PRINCIPAL CITIES

Products

MEDAL FACE BRICK in a variety of colorings and surface textures, including side cut mats, end cut mats, vertical, die cut and sanded textures. Wooster and Carrollton clays produce red ranges of charming variety. Malvern clays afford a brown, buff and ivory color sequence which is available in straight shades or any specified mingling of shades.

AGECROST OLDSTYLE BRICK, for reproducing the effect of antiquity found in classic models of European and Colonial building.

Also Medal Building Tile.

Surface Textures

Medal Brick are furnished in matt textures, vertical textures, and in a die cut as well as the distinctive Agecroft surface, which has been granted a United States patent for originality and merit.

Agecroft Oldstyle Medal Brick

This brick has the general aspect of an early, hand-made brick plus the effect of long weathering. The influence of its surface treatment upon color is to soften and harmonize the brilliant colorings of the Medal Range and to increase their richness. The surface is neither acutely smooth nor systematically roughened. Minor irregularities of outline are preserved without extremity or affectation.

Squared or Beveled Edges—Agecroft brick are furnished with squared edges, or with edges irregularly beveled or rounded, thus increasing the scope of effects obtainable by different joint treatments. Either type of edge has exhibited splendid effects with full mortared or recessed joints in white mortar or color. Perhaps the most prized advantage of the beveled brick is the appearance of a smaller face, when full mortared, without departure from standard dimensions. Thus a mixture of squared and beveled brick, full mortared, gives the effect of pleasing variety of size and the appearance of undulation in the mortar line, without disturbing actual bedding levels.

Agecroft Window Brick

These brick comprise more than thirty specials from which to erect window openings for metal casement windows or double hung windows in harmony with the general exterior treatment of the building. The $\frac{3}{8}$ -in. flange against which the window frame is set gives added security and complete weather protection around the window.

The general design of these windows is based on English precedent, and they afford a consistency not otherwise found in brick construction, as well as marked beauty. Detail drawings are shown for double and single splayed windows, while the lettered illustration on this page is of a simple double splayed window. Variations of these types, including the use of a double mullion for a major division in a large window, will suggest themselves to the architect as soon as he is familiar with the material. Every construction difficulty has been solved

and manufacture simplified so that these beautiful, chamfered brick windows can be specified with economy and certainty of result.

Bulletin and blue prints with full details of single, double and bay windows showing suggested application of trim for veneer and solid wall construction for casement or double hung frames, will be mailed to architects on request.

Agecroft Special Shapes

The architect will find many uses for the above window shapes, aside from window construction. Aside from these shapes, we are especially well equipped to execute orders to your own design for specials to construct chimneys, drip moulds, louvers, etc. The Agecroft surface treatment lends itself remarkably well to specials regardless of their shape.

Color Control and Sorting

Medal Brick are offered in a wide variety of colors. An original system of color control is part of the Agecroft technique, yielding a rich assortment of lighter reds, salmons, ochres and orange tints. With these come deep greens, blues and polychromes with dark and medium reds. A separate Malvern range is offered, varying through warm browns into buff and ivory.

All Medal Brick are sorted on coming from the kiln into piles of like color and re-combined in definite color mingles according to specification.

Co-operative Service

Factory representatives in all territories assist Medal dealers to solve special problems. Name of nearest dealer furnished on request.

SAYRE & FISHER COMPANY

Manufacturers of All Kinds of Brick

261 Broadway (corner Warren Street)
NEW YORK, N. Y.

Products

FINE PRESSED FRONT BRICK; ENAMELED BRICK.

In the Red Brick Department: HARD BUILDING BRICK; SELECTED COLONIAL BRICK; "S. & F." CLINKER STRETCHERS; "RAIN-WASHED," "OLD ENGLISH" RED, REPPRESSED DOWN-DRAFT RED, and REPPRESSED UP-DRAFT RED STRETCHERS, and BLACK HEADERS for Facing; HOLLOW BRICK and FIRE BRICK.

Front Brick in Various Colors

Manufactured by this company in a great variety of colors: white, light and dark buff, red, gray, old gold, rough face Persian and mottled—other shades to order—enabling architects to select a material that, while fire resisting and easily handled, shall permit them to lighten and beautify and add strength and variety to a street façade.

Superior Enameled Brick

Superior enameled brick is manufactured in white and various colors. They are coming into more general use for a great variety of purposes, and are especially adapted for lining of waiting rooms of railroad stations, tunnels, markets, hospitals, engine and boiler rooms, kitchens, etc.

Porcelain (Dull Finish) Enameled Brick for Outside Work

Several million used in prominent city buildings.

Red Brick Department

Hard Building Brick—Hard burned, dark red color. Shipments in cargo lots, via our fleet of barges or schooners, or via rail to all points. A very economical building brick for heavy construction work.

Selected Colonial Brick—For facing. Of general dark red color and sufficiently varied in color and shape for "Harvard" work. These are very desirable for Colonial work.

"S. & F." Clinker Stretchers—These are also for facing. Sometimes called "Clinker Brick," because they are nearest the fire in the kilns and are burned black and twisted.

"Rain-washed" Red Stretchers—A pitted face

brick and laid either with or without Black Headers. A "chance" product caused by rain on the brick when in a green state in open yards.

"Old English" Red Stretchers—This product is something new and is about the size of the Old English Brick, made in dark red tone and measuring about $8\frac{7}{8} \times 2\frac{7}{8} \times 4$ in.

Over 600,000 in the new Curtis Publishing Company's Building in Philadelphia. Selected by the architects after searching the Old World for ideas that were unique and artistic.

Repressed Up-draft Red Stretchers—Same as the Down-draft, except that these show light and dark kiln marks on the stretcher side, which gives a diversified effect.

Repressed Down-draft Red Stretchers—These are of a dark cherry red color and very popular for face work.

Sears, Roebuck Company, Philadelphia, Pa., used 3,000,000.

Black Headers—Made to be used with the Selected Colonial Brick or Repressed Stretchers for the "Harvard" effect if desired.

Hollow Brick—Both stretchers and headers (Haverstraw size) of a very superior quality. They can be furnished in cargo lots.

Fire Brick

Three grades: "Sayre & Fisher Extra," No. 1 "Phoenix" and No. 1 "Flue." Very desirable for boiler settings, furnace linings, etc., in all standard sizes.

Shipping Facilities

The favorable location of the SAYRE & FISHER COMPANY works at deep water on the Raritan River, in New Jersey, permits the loading of vessels of large draught.

Shipments can also be made direct to all points connecting with any line of railroad.

Export Trade

With such adequate and satisfactory facilities for shipment, as well as such large and complete stock always on hand, our export trade has grown to great proportions and is still increasing.

BRICK WORKS OF THE SAYRE & FISHER COMPANY, SAYREVILLE (ON RARITAN RIVER), N. J.

THE STARK BRICK COMPANY

Manufacturers of Stark Salt Glazed Brick

CANTON, OHIO

FACTORY, EAST CANTON, OHIO

REPRESENTATIVES IN ALL PRINCIPAL CITIES

Product

STARK SALT GLAZED BRICK.

A smooth standard size ($8 \times 2\frac{1}{4} \times 3\frac{7}{8}$ in.) fire clay brick, glazed on the face, back and both ends. The glaze is a thin coating of glass fused with the body of the brick, which renders these surfaces impervious.

TRADE-MARK

special purposes, such as the walls of basements, gymnasiums, powerhouses, schools, lavatories, corridors, creameries, and food product plants, laboratories, etc.

They can also be used effectively in fireplaces where the glaze makes them easy to keep clean.

Representation

In order to promptly and efficiently care for the needs of our customers, we have appointed agents in all the principal cities of the United States and Canada, who are constantly in touch with the factory.

A line from you will bring prices, samples, literature and any other information desired, from our nearest representative.

Colors

Stark Salt Glazed Brick are produced in a variety of colors. The glaze is applied during the burning process and being transparent, or nearly so, produces a very pleasing effect.

Shaded Brick—Brick as near as practicable a single color. These shades are designated by the following numbers: 50, 55, 60, 75, 80, 90, and 95. No. 50 is the light shade and No. 95 the dark.

Mingled Shades—A harmonious mixture of colors. We have three distinct mixtures as follows:

Gratones—A blend of gray colored brick.

Buftones—A blend of light buff colored brick.

Darctones—A blend of dark buff and mahogany colored brick.

In addition to the above shades and blends of first quality brick, we have:

Courts—Brick having small defects (mostly handling chips), mingled in shade, light and dark.

Commercials—Brick having larger defects, including factory and kiln marks. This quality is the least expensive and is also free from crooked or warped brick. Mingled in shade, light or dark.

Nature and Uses

The glazed surfaces of the brick may be cleaned with acid. Even such acids as hydrochloric, sulphuric or nitric in concentrated form, will not affect the glaze, although their use in the concentrated form as cleaning agents is not recommended, since they attack cement or lime mortar. An alkaline solution, such as caustic soda, is recommended for this purpose.

Because of the ease with which they can be cleaned, Stark Salt Glazed Brick are used for a variety of

Shape Brick

The illustrations on the following page show the various shapes carried in stock, and include bullnose, cap mould and cove shapes, with which almost any desired architectural effect can be produced. The 2-in. radius is standard.

Special shapes are made to order and require from two weeks to a month to produce.

Shipment of any of the standard shapes can be made immediately from yard stocks.

Our plant is one of the largest salt glaze brick manufactories in the world, having a normal capacity of three million brick per month.

Shipping Facilities

Our plant is located at East Canton, Ohio, on the Wheeling and Lake Erie Railroad, which is able to furnish abundant cars for all requirements. The Wheeling and Lake Erie makes direct connection with the Erie, New York Central, Nickel Plate, Baltimore & Ohio, Michigan Central, Pere Marquette, and other leading trunk lines.

WESTERN BRICK COMPANY

Manufacturers of Face Brick, Common Brick,
Haydite and Featherweight Blocks

GENERAL SALES OFFICE
1604 Builders Building, CHICAGO, ILL.

OFFICE AND FACTORIES
DANVILLE, ILL.

BRANCH SALES OFFICES
INDIANAPOLIS, IND., 804 Hume-Mansur Building
FT. WAYNE, IND., 805 First National Bank Building
REPRESENTATIVES IN ALL PRINCIPAL CITIES OF THE MIDDLE WEST

Facilities

The WESTERN BRICK COMPANY manufactures annually 135,000,000 brick and tile at its two plants.

The shale and clay supply for these factories is practically inexhaustible; fuel supply is owned by the company in sufficient quantities to last at least twenty-five years.

Shipping facilities are unequalled, as the product is distributed from Danville over seven railroads. Plants have side track room for about 75 cars, and ordinary daily shipments, during the building season, exceed 500,000.

Over 1,700,000,000 brick have been manufactured and marketed during the past twenty-seven years.

Western Haydite

Haydite, the material from which the Government's concrete ships were made during the war, is a lightweight, burned clay aggregate, specially manufactured for use in concrete and cement products in place of sand, gravel or crushed rock.

TRADE-MARK

"Western Haydite" weighs less than 1500 lb. per cu. yd. and the finished concrete, therefore, will average from 30 to 40% lighter than that made from regular aggregates.

It is burned in clinker form, then crushed and screened, which gives absolute control of the sizing, as well as producing particles of exceeding sharpness; therefore, it makes a concrete of great compressive and tensile strength.

This aggregate has so many advantages that it is impossible to describe them fully in this one page. Special literature is available, free, upon request.

Western Featherweight Concrete Building Blocks

All of the Western Building Blocks are manufactured from Haydite lightweight aggregate.

In addition to withstanding every test required, no matter how exacting, these blocks in 8x8x16-in. size weigh less than 30 lb. and nails can be driven into them with the assurance that they will not work loose.

This is a new product for 1928 and we expect to produce all standard sizes and shapes.

WYANDOT CLAY PRODUCTS CO.

Manufacturers of Genuine Sand Molded Brick

UPPER SANDUSKY, OHIO

Wyandot Colonials

Wyandot Colonials are genuine sand molded brick, with beautiful color flashing. They have a smooth velvety texture in a color range of blue-black, brown, bright red hearts, dark cherry red, a lighter shade of clear red and a shade of russet bronze.

An exceptionally fine Harvard effect is obtained with this brick.

It is ideal and most consistent for Colonial work and the Tudor and Georgian types of Old English architecture.

Method of Preparing Clay and Plant Construction

The clay deposit at the WYANDOT CLAY PRODUCTS Co. plant is of fine quality and handled to make the finest textured brick possible. It is taken from the pit or storage directly to the huge rotary drying cylinder, where it is thoroughly dried. It then goes to the dry pan crusher, where it is pulverized and then screened through agitating fine mesh screens, which eliminate all foreign substances, reaching the pug-mill in a smooth, fine consistency, where it is molded into a brick of very dense texture and entirely free from laminations.

The brick are hard burned at very high temperature and, while being highly vitrified, the exterior remains smooth and velvety, of beautiful color harmony, but with no glaze or shine.

A huge clay storage shed in which five months' supply of clay is stored, which is used during the winter months, enables the plant to operate all year around, insuring service in any season of the year.

Shipping Facilities

Shipping facilities of the WYANDOT CLAY PRODUCTS Co. are ideal. The plant is located on the Hocking Valley R. R., a few hundred yards from the main line of the Pennsylvania R. R. The Hocking Valley connects directly with all the other east and west main trunk lines north of the Ohio River.

Products

HOLLOW BRICK, HOLLOW BRICK HEADERS.

Also Standard Hollow Backing Tiles, Denison Interlocking Tile; Drain Tile, 3 to 30 in. diameter, inclusive.

Hollow Brick

Delaware Hollow Brick and Headers are standard brick size of design as illustrated. Their purpose is to back-up brick walls where insulation against dampness, heat and cold is desired. Also to lighten the loads on steel work and to eliminate furring, etc.

As hollow brick represent the safe medium between solid brick and hollow tile, partaking of the advantages of both, their use provides insulation without admitting the larger units of hollow backing tiles.

Supply

Having originated, developed and introduced hollow brick in the 90's, we built in 1901 a separate, especially designed factory to make this one article exclusively. The factory has operated continuously since then, turning out annually the largest hollow brick output in the world. Specializing in hollow brick alone in

large volume, this plant has become headquarters for this product throughout the country.

Quality

To satisfy a general preference on the part of contractors for a moderately porous hollow brick, as it aids in stabilizing the wall when laid in unfavorable weather and provides the best type of plastering surface, we manufacture Delaware Hollow Brick from clay, instead of shale or fire-clay, by a special steam-press moulding process, under extreme pressure. Sufficient compression is obtained upon walls and webs to permit comparatively large voids without sacrifice of strength, which provide maximum insulation by increased dead air cells.

Cost

Delaware Hollow Brick weigh about 3 lb. each and may be shipped long distances economically. This company maintains at all times a lower price on Delaware Hollow Brick f.o.b. factory than current price on common brick. Therefore, the architect is safeguarded in specifying them.

Headers are furnished for header courses where required at the same price as stretchers f.o.b. factory.

Products

VITRIFIED SALT-GLAZED CLAY WALL COPING.
FIRE CLAY FLUE LINING.

Vitrified Salt-glazed Clay Wall Coping

Vitrified clay wall coping can not wear out. Sun's heat and frost can not harm it. Moisture can not seep into and disintegrate it. Time can not discolor it.

The soft color of this wall coping blends well with almost any exterior treatment.

To give a smart finished look to the completed work and to insure its walls against decay for all time, specify vitrified salt-glazed clay wall coping.

Fire Clay Flue Linings

According to insurance and fire marshall's reports, at least three out of every ten residence fires start at the chimney—the unreliable chimney is the greatest single cause of residence fires. The architect can completely cut out that hazard in the work he designs by specifying fire clay flue linings for all chimneys and chimney openings and connections.

Following are tables of standard sizes:

Product

CARNEY CEMENT.

Description

THE CARNEY COMPANY has manufactured cement since 1883.

Carney Cement is unlike others used in brick and tile construction. It is made from a peculiar deposit of stone found only at Mankato, Minn. This stone contains the correct proportion of lime combined chemically, so that, when the stone is burned and ground, it needs nothing but sand and water to form a smooth working mortar.

Advantages

Carney Cement is lighter in weight, and is easier handled. It is packed in cloth or paper sacks, each containing 1 cu. ft. and weighing 50 lb. Users of Carney Cement are not required to buy lime, hence labor of slaking and mixing is eliminated. Carney Cement requires nothing but sand and water in mixing.

The simple mixing formula saves time and labor and eliminates the danger of carelessness. Addition of too much sand or adulteration at the mortar box interferes with the plastic, smooth-working properties of the cement and is immediately noticed by the masons.

Because of the plastic and smoother working properties masons can lay more brick per man per day. Carney Cement lays the maximum number of brick per barrel.

Carney mortar has no waste. Mortar left over at

CARNEY CEMENT

for Brick and Tile Mortar

the end of a day or when a job is delayed can be used the next day by re-tempering with water.

Because of its slower set there is no tamping of brick or

re-tempering on the mortar board.

Carney Cement can be used winter and summer. Frost does not affect the strength of Carney mortar in the wall. Printed directions on tags attached to the cement bags provide for its proper use in cold weather.

In the wall, Carney mortar returns to its native hardness, becoming harder than the brick it joins and, as the mortar is absorbed into the brick because of its slower setting properties, it exerts a tremendous gripping power. It makes one solid wall of masonry.

Specifications for Brick, Tile and Terra Cotta Mortar

Plain Mortar—For all brick, tile and terra cotta mortar above grade, use 1 part Carney Cement to 3 or 4 parts sand, depending upon quality of sand in accordance with the manufacturer's directions attached to the cement bags. Carney Cement mortar can be used for brick walls faced with Bedford stone without danger of staining the stone.

Colored Mortar—Use a good, double strength mortar color, and mix according to manufacturer's instructions.

Catalogue and Descriptive Literature

A catalogue covering every point on Carney Cement will be sent on request.

A list of buildings near you that have been laid up in Carney Cement, together with the names and addresses of the architects and contractors, will also be sent, if requested. We list a few below.

Clinton Metallic Paint Company

Mortar Colors, Cement Colors, Protective Paints and Roofing Cement

100 Clinton Road
CLINTON, N.Y.

Branch Office: New York, N.Y., 19 Liberty Street. Telephone, John 3369

Products

Manufacturers of CLINTON MORTAR COLORS and CLINTON CEMENT COLORS.

Also manufacturers of Clinton Iron Oxide Protective Paints and Clinton Silk Fibre Elastic Roof Cement.

Experience

Ever since 1887, the CLINTON METALLIC PAINT COMPANY has served the architectural profession and the building trade. Over 40 years of scientific research and generations of manufacturing experience are reflected in the uniform excellence of Clinton products.

Clinton Mortar Colors

Nature's Permanent Colors—Made Since 1887—at Clinton, N.Y.

Permanent and Uniform

Clinton Mortar Colors are mineral colors, as permanent as the colors in natural rock. Rigid laboratory tests keep them absolutely uniform from shipment to shipment and from year to year.

oratory tests keep them absolutely uniform from shipment to shipment and from year to year.

Directions for Estimating and Using Clinton Mortar Colors

To get a mortar joint of intense color it is advisable to use approximately 100 lbs. of dry mortar color per 1000 brick laid in running or common bond, with half-inch mortar joints. If mortar joints are wider or narrower, or if a bond requiring more or less mortar

Mortar Colored with Clinton Pompeian Buff No. 600

Mortar Colored with Clinton Double Strength Olive Green No. 1503

Mortar Colored with Clinton Special Chocolate No. 404

Mortar Colored with Clinton Colonial Buff No. 700

Clinton Metallic Paint Company

per 1000 brick is used, the amount of mortar color required per 1000 brick should be increased or decreased proportionately.

Following are two formulas for mortar of deep intense color:

Cement Mortar

Clinton Mortar Color (dry)	25 lbs.
Portland cement	1 bag (1 cu. ft.)
Sand	3 cu. ft.
Hydrated lime	1/10 sack

The above is sufficient to lay approximately 250 brick in running or common bond with half-inch mortar joints.

Cement Lime Mortar

Clinton Mortar Color (dry)	30 lbs.
Portland cement	1 bucket (16 qts.)
Hydrated lime	1 bucket (16 qts.)
Sand	6 buckets (96 quarts)

The second formula is sufficient to lay approximately 300 brick in running or common bond with half-inch mortar joints.

As it is not always convenient to weigh the color on the job, we tabulate below the various shades of Clinton Mortar Color, showing in separate columns the number of quarts of dry Clinton Mortar Color (*struck measure*) which are equivalent to 25 lbs. and 30 lbs.

Caution: This table applies only to genuine Clinton Mortar Colors.

	Number of quarts	
	Equiva- lent to 25 lbs.	Equiva- lent to 30 lbs.
Clinton Hematite Red No. 10	10	12
Clinton Mortar Brown No. 400	8½	10½
Clinton D. S. Chocolate No. 402	9	11
Clinton Special Chocolate No. 404	9	11
Clinton Colonial Buff No. 700	19	23
Clinton Pompeian Buff No. 600	19	23
Clinton Dark Buff No. 717	16½	20
Clinton Mortar Black No. 900	18½	22½
Clinton D. S. Black No. 800	19	23
Clinton D. S. Olive Green No. 1503	17½	21

Pearl Gray Mortar may be produced by using one-eighth as much Clinton Double Strength Black No. 800 as is recommended above to produce intense black mortar.

Clinton Mortar Black No. 900 or Single Strength Black, as it is sometimes called, will not give a jet black mortar. For best work use Clinton Double Strength Black No. 800.

If a clear buff mortar is desired a cement-lime mortar is recommended. Light colored cement and sand also tend to make the color of the mortar more brilliant. If a deep buff mortar is

desired it will be obtained most readily by using a cement mortar with cement and sand of dark color.

Many contractors get good results with smaller proportions of Clinton Mortar Colors than those above recommended. This is possible if coarse sand is used and all ingredients are mixed, remixed, then mixed again. Experience, however, proves that the amounts of color recommended will give good results under all conditions and we cannot assure satisfaction if less color is used. *Money spent for a little extra color more than pays for itself, in power and wages saved at the mixer and in the owner's satisfaction with the finished job.*

Coloring of Stucco

The fact that stucco may be tinted has added much to its popularity as a facing material. By use of various Clinton Mortar Colors, it is possible to color stucco in many pleasing tones.

The following formula is suggested:

1 quart Clinton Color
10 quarts <i>White</i> Portland Cement
30 quarts White Sand or Marble Dust

This batch covers about 125 sq. ft. finish coat. Only the finish coat need be colored. Not to exceed one quart of Hydrated Lime may be added to this batch, if desired.

Shade Produced

Name of Clinton Color to be used.		Approximate weight per quart
Rich Red	Clinton Red Cement Color No. 92	2½ lbs.
Rich Pink	Clinton Hematite Red No. 10	2¾ lbs.
Pinkish Brown	Clinton Mortar Brown No. 400	3 lbs.
Seal Brown	Clinton Brown Cement Color No. 1150	1½ lbs.
Pinkish Buff	Clinton Pompeian Buff No. 600	1½ lbs.
Light Cream	Clinton Colonial Buff No. 700	1½ lbs.
Brilliant Yellow	Clinton Yellow Cement Color No. 715	1 lb.
Deep Buff	Clinton Dark Buff No. 717	1¾ lbs.
Turquoise Green	Clinton Green Cement Color No. 1502	2 lbs.
Light Blue	Clinton Blue Cement Color No. 1601	1¼ lbs.
Light Gray	Clinton Mortar Black No. 900	1½ lbs.
Deep Gray	Clinton Double Strength Black No. 800	1½ lbs.

Folder No. 300 including above data and additional practical information concerning mixing and use of Clinton Colors will be gladly sent upon request.

Specification

All coloring material to be manufactured by Clinton Metallic Paint Co., Clinton, N. Y., to be delivered on the job in original packages bearing their labels, and to be used according to directions which they will furnish.

Duo- and Multi-colored Stucco

Here are illustrated two panels of duo-colored stucco made with Clinton Colors. Folder No. 301 containing instructions for producing these effects together with more detailed instructions concerning the use of Clinton Colors in stucco will be gladly sent if requested.

KOSMOS PORTLAND CEMENT COMPANY

INCORPORATED

SALES OFFICE

LOUISVILLE, KY.

MILL: KOSMOSDALE, KY.

Products

KOSMORTAR, and KOSMOS PORTLAND CEMENT.

Kosmortar

A very smooth working cement for masonry of all kinds. Mixed with sand and water only, by hand or machine, it is ready for immediate use. No slaking. No additions. Minimum labor.

Characteristics of Kosmortar

Strength—Ample for all masonry. Makes mortar of about the same strength as a 50% mixture of portland cement and lime with much better working qualities.

Appearance—The natural color of Kosmortar is a light gray. It contains nothing that will react unfavorably on mortar colors, or cause efflorescence. Joints cut clean, giving a neat effect, and saving much labor. For practical purposes it is non-staining with Bedford stone.

Durability—Kosmortar passes the same soundness test as portland cement. Every step in its manufacture is under complete control and it may be depended upon for uniformity. Joints made with Kosmortar are water repellant to a high degree.

Set—Kosmortar is made slow setting to permit placing in the wall without rettempering, which is never necessary with Kosmortar under proper management. Rettempering a mason's cement sacrifices the advantages of strength, speed and labor saving that are the chief reasons for using this modern substitute for lime. It may be done but it should not be done, and Kosmortar is so made that it is not necessary. The set is accelerated somewhat for winter shipments.

Package—Kosmortar is packed only in multiwall paper sacks which give the maximum protection and allow no refilling. A sack weighs 75 lb. The unit of sale is a barrel of 300 lb., which means four sacks. Directions for use on each sack.

Amount Required—This varies with the sand used and the ideas of the various bricklayers. A good average is 1 barrel (4 sacks) of Kosmortar to 1000 brick. In tests as many as 1284 brick have been laid (slushed joints) with a barrel of Kosmortar without detracting from the strength or plasticity.

Opinions of Kosmortar

Architect—"Kosmortar joints are hard and durable, providing an excellent bond."

JOSEPH AND JOSEPH, Architects, Louisville, Ky.

Brick Manufacturer—"We believe Kosmortar is the best of the mason's cements and are especially enthusiastic about its performance with mortar colors in connection with our face brick".

DECATUR BRICK COMPANY, Decatur, Ill.

Contractor—"Our brick foremen believe that your product is the best of the patented cement mortars from the standpoint of economy and fast brick laying. The masons particularly like Kosmortar because of the ease of handling, and our experience with it on numerous jobs justifies their belief."

THE MIDDLE STATES CONSTRUCTION COMPANY,
Columbus, Ohio

Report of Kosmortar Tests

(1) Made by Robert W. Hunt & Co., Chicago, Ill., from sample received March 23, 1923.

Soundness O.K.

Time of Setting:

Initial 6 hr. 00 min.

Final 17 hr. 30 min.

Fineness:

Passing 100 mesh..... 95.80%

Passing 200 mesh..... 81.40%

Tensile Strength (1 part Kosmortar, 3 parts sand):

Average 7 days..... 70 lb. per sq. in.

Average 28 days..... 155 lb. per sq. in.

(2) Made by H. C. Nutting Co., Cincinnati, Ohio, from sample received February 20, 1924.

Compression Strength (1 part Kosmortar to 3 parts sand):

28-day test..... 1376 lb. per sq. in.

Tests of Kosmortar along with other mortars for working qualities, color and strength, are welcomed. Kosmortar excels other prepared mortars in working qualities and will give at least 50% more strength.

Kosmos Portland Cement

Many twenty-year old buildings of all sorts prove its durability. It responds exceptionally well to modern methods of concrete making for high early strength.

In July, 1927, a piece of roadway near Kosmosdale, required for immediate use, was laid with Kosmos cement, using a 1 : 2 : 3 mix and 5 gal. of water to a sack, giving a 1-in. slump. In 21 hours after laying, loaded trucks of a gross weight of 11½ tons were run over this roadway and have been using it ever since without sign of failure.

Cylinders of this concrete gave strength in compression of 1256 lb. per sq. in. in 24 hours,

• N O T E •

HORIZONTALLY ROLLING WINDOWS ARE FURNISHED ONLY IN THE TYPES AND SIZES SHOWN ABOVE.

WE DO NOT RECOMMEND THIS CONSTRUCTION WHERE WEATHERTIGHTNESS IS REQUIRED.

THE GUIDE BRACKETS ARE ATTACHED IN SHOP AND THE ROLLER BRACKETS SHIPPED LOOSE TO BE ATTACHED AT ERECTION.

TO DETERMINE THE TOTAL OPENING DIMENSION MULTIPLY THE WINDOW DIMENSION BY THE NUMBER OF UNITS USED.

THE STRUCTURAL STEEL FRAMING AND TRACK, FURNISHED BY OTHERS, MUST BE OF SUFFICIENT STRENGTH OR BRACED SECURELY BETWEEN SPANS TO SUPPORT WINDOWS AND PREVENT SAGGING.

THE DIMENSIONS MARKED 'IMPORTANT' MUST BE FOLLOWED CLOSELY FOR THIS TYPE OF WINDOW.

(P) CONTINUOUS TOP HUNG WINDOWS—Specifications

Notes are explanatory or advisory only and need not be included in the specifications.

Note: Structural Steel Truss spacing, best adapted to the use of standard Continuous Window units, is in multiples of 4' (16', 20', 24') to accommodate standard 4' centering for girt butt attachment.

Note: Intermediate structural vertical members should be provided approximately 8' to 12' apart.

Note: Structural Steel Girts, at heads and sills of Continuous Windows, are not furnished by the Window Manufacturer, and are so noted on the window details. These girts should be provided for in the Structural Steel Specifications including punching for attachment of window butts in accordance with standard Fenestra punching details. (See Fenestra, Page 51.)

Note: Sheet metal flashing at heads, sills, and ends of runs at building construction, is not furnished by the Window Manufacturer, and is so noted on the window details. This flashing should be provided for in the Roofing and Sheet Metal Specifications.

(P-1) Work Included

Note: List and locate. (See paragraph 13, Fenestra Page 2.)

(P-2) General

Continuous Top Hung Windows shall be Fenestra as manufactured by DETROIT STEEL PRODUCTS COMPANY.

Note: Fenestra Continuous Windows are particularly designed for use in monitor and sawtooth roof construction where the plane of the windows is on a slope. They may be used in vertical planes where necessary. The chief advantage of this type of window lies in the fact that it provides for an easily and rapidly operated continuous opening from one end of the building to the other.

Note: Standard units of Continuous Windows measure 20' in length (dimension points equal the clear opening). We recommend, for the economical arrangement of operator arms and to permit girt punching on even 4' centers for butt attachment, that units vary on multiples of 4' (8', 12', 16'). Smaller units may be used, if necessary, in widths varying in multiples of 2' (8', 10', 12', 14', 16', 18').

(P-3) Materials

(P-3a) Window Sections—All sections shall be specially designed, hot rolled, solid steel bars with heavy fillets in all re-entrant angles.

(P-3b) Head and End Jamb Members—Head and end jamb members shall be special angles.

(P-3c) Muntins—Muntins shall be special Ts 1½" deep.

(P-3d) Sills—Sills shall be special design sections with a long down-standing leg bent at the end to make close contact with the building construction. Provide weep holes for drainage.

(P-4) Construction

(P-4a) Window Units—All members of the window shall be accurately fitted and rigidly riveted at the joints to form standard panel units. Panels shall be joined, end to end midway between T muntins, by splice plates bolted to head and sill members.

Note: Panels are joined at the time of erection.

Note: Riveted assembly assures a strong, tight joining of members, with sufficient flexibility to withstand unusual strain thus obviating the danger of breaks due to imperfect welds.

(P-4b) Stationary End Sections—At the ends of all swing sections next the building construction there shall be provided stationary 1' panels.

(P-4c) Stationary Intermediate Sections—Between the ends of swing sections there shall be provided stationary 2' panels.

(P-4d) Weathering Caps—The joint between ends of swing sections and stationary end sections (and stationary intermediate sections) shall be covered and protected by a specially formed, 14 gauge, steel channel with one leg secured to the end angle of the swing section and designed to overlap the end angle of the stationary section.

(P-4e) Storm Panels—Where so indicated, provide 2' wide storm panels secured to stationary end (and intermediate) panels with a steel plate and to the sill by sill clips. Panels shall underlap the swing window section and shall be provided at sill with a formed continuous drip board, set over the sill flashing.

(P-5) Attached Hardware

Note: Attached at factory.

Butts—All Continuous Windows shall be top hung on heavy malleable iron butts, with ⅜" brass pins, spaced 4' apart on centers. Butts shall be rigidly riveted to the head angle and furnished with bolts for attachment to the building girts.

(P-6) Mechanical Operators

Note: Specifications for mechanical operators are given on Fenestra Pages 55 to 59. In selecting type best adapted to the particular conditions, we advise consultation with our representative.

(P-7) Erection

All Continuous Windows shall be erected by the FENESTRA CONSTRUCTION COMPANY, under a separate contract.

Note: See Paragraph 5, Fenestra Page 1.

All windows shall be erected in a thoroughly, workmanlike manner ready for glazing.

(P-8) Painting

All windows shall be given one dip-coat of red mineral paint by the manufacturer before shipment.

Note: The following should be provided for in the Painting Specifications:

One additional coat of paint should be applied after erection before glazing. Further painting should be deferred until at least three weeks after glazing to allow putty to set. One or more additional coats may then be applied as required.

Note: Where desired, the FENESTRA CONSTRUCTION COMPANY (see Paragraph 5, Fenestra Page 1) at reasonable added cost will do field painting after erection. If required, so specify here, including specification for paint and its application.

(P-9) Glass and Glazing

Note: The following should be included in the Glazing Specifications:

Note: See Paragraph 10, Fenestra Page 2.

(P-9a) Glass—Glass shall be (¼" rough wire glass).

(P-9b) Putty—Putty shall be a high grade of steel window putty.

Note: Ordinary wood sash putty must not be used. See paragraph 11, Fenestra Page 2.

(P-9c) Glazing—All continuous windows shall be glazed from the outside. All glass shall be set in a heavy bed of putty and secured at muntins and end angles by angle clips secured with bolts. Face putty at sills, applied in a neat, clean-cut, smooth manner.

Note: Do not paint until putty has thoroughly hardened. (See note Paragraph P-8.)

Continuous Fixed Windows

Note: The specification for Continuous Fixed Windows is the same as that for Continuous Top Hung Windows except that all window units are stationary (no swing sections). Heavy steel angle clips bolted to the window head and the building girts are substituted for the butts. Steel sill clips, furnished with the window and shipped flat, are bolted to the sill of the window and bent around the steel sill girt to rigidly secure the window in position at the bottom.

Continuous Bottom Hung Windows

Note: In general the specification for Continuous Bottom Hung Windows is the same as that for Continuous Top Hung Windows except in the following particulars:

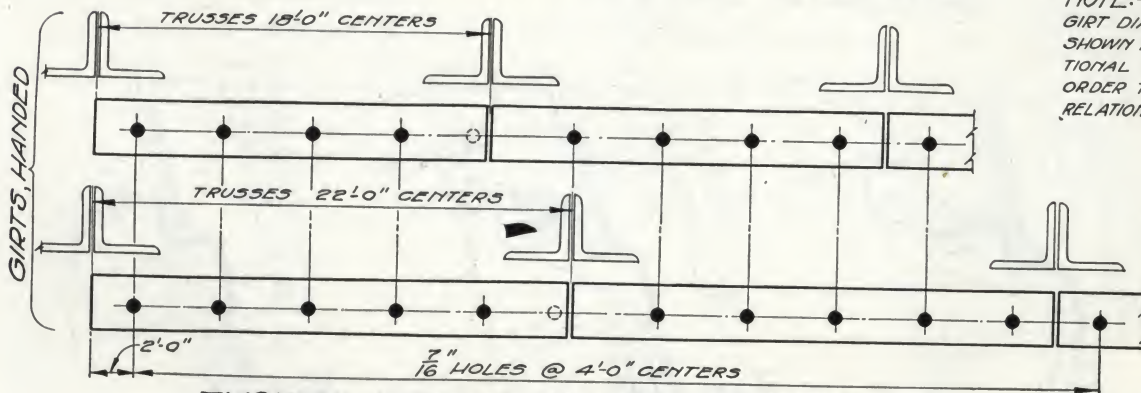

- The head section is a special T.
- The sill section is a special angle designed to take the butts attached to a special sill girt.
- The weathering caps are attached, with the legs out, to the fixed end or intermediate panels instead of to the swing sections.
- The windows are glazed on the inside with face putty at both head and sill.

**RECOMMENDED TYPICAL LAYOUT OF GIRT PUNCHING
FOR STANDARD 20'-0" TRUSS CENTERS.**

**TYPICAL LAYOUT OF GIRT PUNCHING FOR
TRUSS CENTERS OF 16, 20 AND 24'-0"**

**TYPICAL LAYOUT OF GIRT PUNCHING FOR
TRUSS CENTERS OF 18 AND 22'-0"**

NOTE:-TRUSSES ON GIRT DIAGRAM ARE SHOWN IN A CONVENTIONAL MANNER IN ORDER TO SHOW THE RELATIONSHIP TO GIRTS.

SPACING OF TRUSS CENTERS:-
TRUSS CENTERS OF 17, 19, 21, 23 AND 25 FEET REQUIRE FOUR STYLES OF GIRT PUNCHING (TWO RIGHT AND TWO LEFT) AND SHOULD THEREFORE BE AVOIDED.

GIRT PUNCHING:-
HOLES OCCURRING AT JOINT OF GIRTS SHOULD BE OMITTED. SUCH HOLES WILL BE LOCATED AND PUNCHED BY WINDOW ERECTORS

MECHANICAL OPERATING DEVICES

While the designing of mechanical operators for the various types of Fenestra windows is not in any sense complicated, so many different building conditions are encountered that it is impossible to lay down hard and fast rules, limits and specifications which the architect may use without first consulting a Fenestra representative.

The following specifications and plates therefore should be regarded as explanatory and advisory only.

Fenestra operators are not sold as separate and distinct products, but rather as a method of securing the satisfactory opening and closing of Fenestra windows by mechanical means. Therefore, any mechanical operators recommended by Fenestra representatives are

just as dependable as the Fenestra butt or cam handle or any other standard device which the architect himself might specify.

All operating equipment, and especially electrically controlled equipment, needs occasional inspection and lubrication. Therefore, provision should be made by which powers and motors may be reached without undue inconvenience. A "cat walk" or a movable platform is suggested where ladders are impractical.

A plate door is sometimes installed in the fixed panels between the runs of Continuous Windows so that the powers may be reached from the roof. Such doors may be had at added cost if specified.

(SA) WORM AND GEAR OPERATOR—Specifications

Notes are explanatory or advisory only and need not be included in the specifications.

Note: This operator is designed primarily for horizontally pivoted ventilators but may, in some cases, be used on top pivoted ventilators.

(SA-1) Work Included

Note: List and locate. (See paragraph 13, Fenestra Page 2.)

(SA-2) General

All operators, so indicated, shall be Fenestra Worm and Gear as manufactured by DETROIT STEEL PRODUCTS COMPANY.

(SA-3) Material

(SA-3a) Power—Power shall be a machine cut, cast iron worm operating a cast iron segmental worm gear assembled in a steel power housing designed for adjustable attachment to the supporting bracket. The worm shall be equipped with a ball thrust bearing to eliminate friction. The hub of the segment gear shall be reamed to fit the power transmission line and shall be so rigidly secured as to rotate the line on the gear axis. Power shall be supported on heavy steel brackets adapted to rigid attachment to the building construction.

Note: Power may be erected in an inclined or inverted position to clear cranes, pipes or other obstructions.

Note: The power may be located at either end of the run or at any intermediate point. Recommended limits are given on Fenestra Page 61.

(SA-3b) Power Transmission—Power line shall be 1" black, wrought iron pipe joined into a continuous line by steel pipe plugs, with a drive fit, riveted in two directions. Line shall be supported on adjustable steel brackets, bolted to the window mullions or to the building construction. Adjustable steel operating arms (one to each ventilator) shall be rigidly clamped to the line and pivoted to steel arm extensions attached to the ventilators through steel hinge brackets.

(SA-3c) Manual Operation—

Note: Select type.

Power for Worm and Gear Operator

(1) Chain—Power shall be operated by a chain, operating over a chain wheel. Chain shall be guided by a suitable guard. Hub of chain wheel shall be broached to accurately fit the flattened end of the worm shaft and shall be secured by a set screw. A cotter pin through end of the shaft shall be provided for additional protection.

Note: When the power must be erected in an inclined or inverted position (see Note SA-3a) to clear obstructions or to make the ventilators visible from the operating station, chain may be carried over idlers to any convenient point.

(2) Pipe—Power shall be operated by a 1" black, wrought iron pipe connected to the worm shaft and carried down vertically to a miter gear (with removable crank) encased in a gear box adapted to rigid attachment to the building construction approximately 4' above the floor.

Note: When the power is installed in an inclined or inverted position (see Note SA-3a) the pipe may be offset through the use of universal joints.

(SA-4) Painting

All operators shall be painted one (1) coat of red mineral paint by the manufacturer before shipment.

Note: Further painting should be provided for in the Painting Specifications.

Note: Where desired, the FENESTRA CONSTRUCTION COMPANY (see Paragraph 5, Fenestra Page 1), at reasonable added cost will do field painting after erection. If required, so specify, including specifications for paint and its application.

(SA-5) Erection

All operators shall be erected by the FENESTRA CONSTRUCTION COMPANY.

Note: See Paragraph 5, Fenestra Page 1.

All operators shall be erected in a thoroughly substantial, workmanlike manner and left in perfect working order.

(SB) RACK AND PINION OPERATOR—Specifications

Notes are explanatory or advisory only, and need not be included in the specifications.

Note: This operator is primarily adapted for use on ventilators pivoted 4" from the top, but can be used successfully on horizontally pivoted ventilators.

(SB-1) Work Included

Note: List and locate. (See Paragraph 13, Fenestra Page 2.)

(SB-2) General

All Operators, so indicated, shall be Fenestra Rack and Pinion as manufactured by DETROIT STEEL PRODUCTS COMPANY.

(SB-3) Material

(SB-3a) Power—

Note: Three types of power are available. Select and specify that best adapted to the condition.

Note: Power may be located at either end of the run or at any intermediate point of the run. Recommended limits are given on Fenestra Pages 62 and 63.

(1) Light Power—Light Power shall be a 32 to 1 reduction, machine cut steel, worm operating a semisteel worm gear

assembled in a steel power housing designed for adjustable attachment to the supporting bracket. The worm shall be equipped with a ball thrust bearing to reduce friction. The hub of the gear shall be reamed to fit the power transmission line and shall be so rigidly secured as to rotate the line on the gear axis. Power shall be supported on a heavy steel bracket adapted to rigid attachment to the building construction.

Note: Power may be erected in an inclined or inverted position to clear cranes, pipes, or other obstructions.

(2) **Heavy Power**—Heavy Power shall be a 45 to 1 reduction machine cut, steel worm operating a semisteel worm gear assembled and oil-encased in a dustproof gear box. The worm shall be equipped with a ball thrust bearing to reduce friction. The hub of the gear shall be reamed to fit the power transmission line to which it shall be securely attached so as to rotate the line on the gear axis. Power shall be supported on a heavy steel bracket adapted to rigid attachment to the building construction.

Note: Power may be erected in an inclined or inverted position to clear cranes, pipes, or other obstructions.

Rack and Pinion Operator, Manually Controlled

(3) **Electrical Power**—Electrical Power shall be a 71 to 1 reduction, machine cut, steel worm operating a semisteel worm gear assembled and oil-encased in a dustproof gear box. The worm shall be equipped with a ball thrust bearing to reduce friction. The hub of the gear shall be reamed to fit the power transmission line and shall be so rigidly secured as to rotate the line on the gear axis. The power shall be operated by a cast iron sprocket wheel keyed to the worm shaft and motor driven through a chain drive. The electrical equipment shall be mounted directly beneath and joined to the power gear case forming a complete power unit. The power unit shall be supported on heavy steel brackets adapted to rigid attachment to the building construction.

Note: Complete specifications of Electrical Equipment are given on Fenestra Page 59 and should be included here.

(SB-3b) **Power Transmission**—Power Transmission lines shall be 1" black, wrought iron pipe joined into a continuous

line by steel pipe plugs, with a drive fit, riveted in two directions.

Lines shall be supported on adjustable, steel brackets, bolted to window mullions or to building construction. Operating arms (one to each ventilator) shall be straight steel racks, clamped in mesh with pinions, rigidly secured to the line. (Arms shall be attached at the head of horizontally pivoted ventilators to pressed steel hinge brackets, and shall pull in.) (Arms shall be attached at the sill of top pivoted ventilators to Z bar brackets through pressed steel hinge brackets and shall push out.)

Note: Specify either or both arm attachments as required.

(SB-3c) Manual Operation—

Note: Select either type for "Light" or "Heavy" Power. Omit if Electric Power is used.

(1) **Chain**—Power shall be operated by a chain operating over a chain wheel. Chain shall be guided by a suitable guard. Hub of chain wheel shall be broached to accurately fit the flattened end of the worm shaft and shall be secured by a set screw. A cotter pin through the end of the shaft shall be provided for additional protection.

Note: When the power must be erected in an inclined or inverted position (see Note SB-3a) to clear obstructions or to make the ventilators visible from the operating station, the chain may be carried over idlers to any convenient point.

(2) **Pipe**—Power shall be operated by a 1" black wrought iron pipe connected to the worm shaft and carried down vertically to a miter gear (with removable crank) encased in a gear box adapted to rigid attachment to the building construction approximately 4' above the floor.

Note: When the power is installed in an inclined or inverted position (see Note SB-3a), the pipe may be offset through the use of universal joints.

(SB-3d) **Electrical Operation**—Power shall be electric, motor operated.

Note: See Electrical Power (SB-3a3).

(SB-4) Painting

All operators shall be painted with one (1) coat of red mineral paint by the manufacturer before shipment.

Note: Further painting should be provided for in the Painting Specifications.

Note: Where desired, the FENESTRA CONSTRUCTION COMPANY, (see Paragraph 5, Fenestra Page 1,) at reasonable added cost, will do field painting after erection. If required so specify here, including specifications for paint and its application.

(SB-5) Erection

All operators shall be erected by the FENESTRA CONSTRUCTION COMPANY.

Note: See Paragraph 5, Fenestra Page 1.

All operators shall be erected in a thoroughly substantial, workmanlike manner and left in perfect operating condition.

(SC) SCREW TYPE OPERATOR—Specifications

Notes are explanatory or advisory only and need not be included in the specifications

Note: This operator is designed primarily for use on exceptionally high openings such as those in power houses, entirely filled with windows and structural mullions. It may be used on either horizontally pivoted ventilators or ventilators pivoted 4" from the top in individual bays, either within or beyond reach from the floor. The operator lies close to the inside face of the window out of the way of cranes and other obstructions. Where so provided for, powers and electrical mechanism may be concealed within the wall.

(SC-1) Work Included

Note: List and locate. (See Paragraph 13, Fenestra Page 2.)

(SC-2) General

All Operators, so indicated, shall be Fenestra Screw Type as manufactured by DETROIT STEEL PRODUCTS COMPANY.

(SC-3) Material

(SC-3a) Power—

Note: Two types of power are available. Select and specify that best adapted to the condition.

Note: The power may be located at either side of the opening or at any intermediate point. Recommended limits are given on Fenestra Pages 64 and 65.

Note: In bays of extreme width and height, flexibility of ventilator control may be secured by operating the upper runs from one power and the lower runs from another.

(1) **Manual Power**—Power shall be applied through open bevel gears to operate a $\frac{3}{4}$ " vertical threaded, steel shaft in an upward and downward direction.

Note: The operation is similar to that of an automobile jack.

Gears shall be operated by a hand wheel provided with a handle.

The power shall be assembled within and shall be supported by an open, cast iron housing adapted to rigid attachment to the window mullion or building construction.

Provide a guide secured to the vertical shaft which shall fit over a guide T, attached to the window mullion. Guide T shall be provided with stops which shall limit the travel of the guide and shaft.

(2) **Electrical Power**—Power shall be applied through bevel gears to operate a $\frac{3}{4}$ " vertical threaded, steel shaft in an upward and downward direction. The gears shall be assembled and oil-encased in a dust-proof gear-box. Gears shall be operated by electrical power either direct connected through a universal joint or by means of a cast iron sprocket and chain drive.

The electrical equipment and the gear case shall be mounted to form a complete unit on a heavy steel bracket plate adapted to rigid attachment to the building construction.

Note: Complete specifications of Electrical Equipment are given on Fenestra Page 59 and should be included here.

(SC-3b) **Power Transmission**—Power transmission lines shall be 1" black wrought iron pipe joined into a continuous line by steel plugs, with a drive fit riveted in two directions. Lines shall be supported close to the face of the win-

dow on heavy cast iron brackets rigidly attached to the mullions and building construction. Cast iron pivoted lever arms (two to each ventilator) shall be rigidly clamped to the power lines and attached to the ventilator jamb bars with malleable iron hinge brackets.

Heavy cast iron cross heads, secured to the vertical power shaft, shall operate attached cast iron rocker arms rigidly clamped to the power lines. When the power is applied the rocker arms shall rotate the power lines.

(SC-4) Painting

All operators shall be painted with one (1) coat of red mineral paint by the manufacturer before shipment.

Note: Further painting should be provided for in the Painting Specifications.

Note: Where desired the FENESTRA CONSTRUCTION COMPANY (see Paragraph 5, Fenestra Page 1) at reasonable added cost will do field painting after erection. If required, so specify here, including specifications for paint and its application.

(SC-5) Erection

All operators shall be erected by the FENESTRA CONSTRUCTION COMPANY.

Note: See Paragraph 5, Fenestra Page 1.

All operators shall be erected in a thoroughly substantial, workmanlike manner and left in perfect working order.

Screw Type Operator, Electrically Controlled

(SD) TENSION OPERATOR—Specifications

Notes are explanatory or advisory only and need not be included in the specifications.

Note: Tension Operators are in general design and operation similar to Continuous Operators. They are made for use on long runs of horizontally pivoted windows. The chief difference is in the design of operating arms and the chief advantages lie in its easy operation and the fact that windows up to 300' may be operated from one power.

Note: To avoid repetition where the specifications are the same as that for Continuous Operator this is so noted. Where not identical, use clauses here given. For specification for Continuous Operator, see Fenestra Page 58.

(SD-1) Work Included

Note: Same as (SE-1).

(SD-2) General

All horizontally pivoted ventilator operators, so indicated, shall be Fenestra Tension Operators as manufactured by DETROIT STEEL PRODUCTS COMPANY.

(SD-3) Material

(SD-3a) Power—

Note: Same as (SE-3a).

(SD-3b) Stops—

Note: Include only, where Manual operation is used.

On either side of the power case, the worm shaft shall extend to receive rigidly attached, double, steel, stop clutches (two in all). As the operator opens the window an auxiliary stop attached to the rack shall strike the upper end of a steel lever (pivoted to a bracket on the power case) causing the lower end of the lever (which is broached over the worm shaft) to engage one of the stop clutches and cut off the power. When the operator closes the window, a similar arrangement shall function to automatically cut off power at the proper point. Levers and clutches for each stop shall be automatically disengaged by coil springs. No stop which merely halts the movement of the power line without cutting off the power will be accepted.

(SD-3c) Power Supports—

Note: Same as (SE-3c).

(SD-3d) Power Transmission—

Note: Same as (SE-3d).

(SD-3e) **Operating Arms**—Operating arms shall be adjustable, straight, steel channels. Arms shall be rigidly attached, through a malleable iron and steel universal swivel clamp, to the tension line and the other end shall be secured to the top of the window through a steel pivoted hinge. Arms shall operate to pull the window in from the top.

(SD-3f) Manual Operation—

Note: Same as (SE-3f).

(SD-3g) Electrical Operation—

Note: Same as (SE-3g).

(SD-4) Painting

Note: Same as (SE-4).

(SD-5) Erection

Note: Same as (SE-5).

Section of Fenestra Tension Operator Attached to Standard Horizontally Pivoted Ventilators and Manually Operated by Power, Equipped with Chain Wheel and Chain

(SE) CONTINUOUS OPERATOR—Specifications

Notes are explanatory or advisory only and need not be included in the specifications.

Note: This operator is designed to operate from a single power, one or several continuous windows in line (top hung, or bottom hung) located in either vertical or sloping planes.

Note: The power developed through the tension line is applied to the window through straight motion levers so arranged that the leverage increases faster than the load thus making the operation continuously easier as the window opens. This is a basic principle exclusive in Fenestra Continuous Operator.

Note: The unusually heavy construction, and the extreme care with which all material is selected and fitted, give this power exceptional strength and reliability.

(SE-1) Work Included

Note: List and locate. (See Paragraph 13, Fenestra Page 2).

(SE-2) General

All continuous window operators shall be Fenestra Continuous Operators as manufactured by DETROIT STEEL PRODUCTS COMPANY.

(SE-3) Material

(SE-3a) Power—Power shall consist of a case hardened, machine cut, high carbon steel worm operating a special alloy, non-ferrous bronze, worm gear with straight face, machine cut teeth and extra heavy hub and rim. Worm and gear shall be oil-encased, assembled in an accurately machined, oil-tight box. Worm and worm shaft shall be turned down from a solid steel bar. The worm shaft shall be made with long radial bearing surfaces and shall be provided with ball thrust, friction reducing bearings.

Note: The unusual length of the worm shaft radial bearing surfaces assures gear alignment and ease of operation without binding.

The worm gear shall fit tightly over a 1" squared, steel shaft which shall extend to drive a high carbon steel, heat treated pinion in mesh with a rack.

Worm gear and pinion shall be separated by a spacer and all three shall be broached out to accurately fit the shaft with the permanence and reliability of a single piece.

The rack shall be of high carbon steel with machine-cut teeth of stub tooth design. The rack shall be suspended at each end from the power transmission tension line, by rigid rack hangers which thrust against clamps securely attached to the line, thus transmitting the power in a horizontal direction.

Note: The length of runs which may be operated from a single power can only be determined by consultation with a Fenestra representative since numerous factors must be considered, such as: the type of windows (top hung, bottom hung, etc.), their location (vertical or horizontal plane), their height, the degree of opening desired, the time permitted for opening or closing, and, if manually operated, the effort to be exerted on the chain.

(tension) line shall be 1" black, wrought iron pipe in lengths not to exceed 20', joined into a continuous line by solid steel plugs, with a drive fit, riveted in two directions.

Tension line shall be supported on 2"x3" steel angle brackets with legs turned down, spaced approximately 10' apart and rigidly attached to the building construction.

Brackets shall be slotted to permit adjustment and shall carry at their upper, outer ends, cast iron roller housings and solid steel rollers to support the tension line.

(SE-3e) Operating Arms—Operating arms or levers shall be steel angles consisting of two arms, one twice as long as the other.

Note: The operating arm assemblies are spaced in conjunction with the tension line brackets, approximately 10' apart.

One end of the long arm shall be rigidly clamped through a universal pivoted joint, to the tension line and the other end shall be secured to the window through a universal pivoted joint bracket. One end of the short arm shall be attached through a universal pivoted joint to the top of the cast iron roller housing on the tension line support bracket, the other end being pivoted to the center of the long arm.

All universal joints shall be provided with bronze bushings.

(SE-3f) Manual Operation—Power shall be operated by a chain operating over a chain wheel. Chain shall be guided by a suitable guard. Hub of chain wheel shall be broached to accurately fit the extended, flattened end of the worm shaft and shall be secured by a set screw, a cotter pin through the end of the shaft providing additional protection.

Note: To clear obstructions or make the windows visible from the operating station, chain may be carried over idlers to any convenient point.

(SE-3g) Electrical Operation—Power shall be operated by an electrical power unit operating through a sprocket and chain. Hub of sprocket shall be keyed to the extended end of the worm shaft. Electrical power unit shall be mounted beneath and secured to the power by rigidly attached auxiliary steel brackets.

Note: Complete specifications of Electrical Equipment given on Fenestra Page 59, should be included here.

(SE-4) Painting

All operators shall be painted one (1) coat of red mineral paint by the manufacturer before shipment.

Note: Further painting should be provided for in the Painting Specifications.

Note: Where desired, the FENESTRA CONSTRUCTION COMPANY (see Paragraph 5, Fenestra Page 1) at reasonable added cost will do field painting after erection. If required, so specify here, including specifications for paint and its application.

(SE-3b) Stop—

Note: Include only where Manual Operation is used.

Opposite the worm drive wheel, the worm shaft shall extend to receive a rigidly attached steel stop clutch. As the operator closes the window, an auxiliary stop attached to the rack, shall strike a malleable iron lever causing it to engage the stop clutch, and cut off the power. As the operator opens the window, the lever and clutch are disengaged automatically by a coil spring. No stop which merely halts the movement of the power line without cutting off the power will be accepted.

(SE-3c) Power Supports—Each power shall be supported by two steel brackets, especially designed to withstand great lateral pressure. Each bracket shall be rigidly attached to the building construction and shall be trussed with ½" tension rods with adjusting U bolt hangers.

(SE-3d) Power Transmission—Power transmission

Power for Fenestra Continuous Operator, showing chain wheel, chain guard, rack and tension line. Note the wide power supports and the wide bearing surface provided for both the worm shaft and the gear shaft. The specially designed Fenestra stop is shown on the worm shaft at the opposite end from the chain wheel

(SE-5) Erection

All operators shall be erected by the FENESTRA CONSTRUCTION COMPANY.

Note: See Paragraph 5, Fenestra Page 1.

All operators shall be erected in a thoroughly substantial, workmanlike manner and left in perfect working order.

Above is shown a "close up" of the power transmission on Fenestra Continuous Operator. Note the 2x3 in. steel angle bracket supporting the line; the two operating arms, one twice as long as the other: one end of the long arm clamped to the pipe through a universal joint and the other attached to the window. The short arm is attached to the top of the cast iron roller housing while the other end is pivoted to the center of the long arm. For detailed description, see Paragraph SE-3e, Fenestra Page 58

At the right is shown part of two runs of Fenestra Continuous Operator as installed in the plant of the Commonwealth Steel Co., Granite City, Ill. The upper run of windows is closed while the lower run is partially open. This picture illustrates very well the operation of long runs of continuous top hung windows from a single power

CONTINUOUS WINDOW OPERATOR(CABLE TYPE)

Note: This operator is primarily adapted to use on Vertically Pivoted Windows.

The operator is designed for either hand or electrical operation and is identical to the continuous window mechanical operator except in one respect. Both ends of the transmission line are connected to chains which pass over roller bearing idlers rigidly supported on steel idler brackets (guyed to the building construction where possible) and are attached to continuous steel rods. The steel rods are carried directly beneath the transmission tension line and are supported through holes in the tension line brackets. The ends of the steel rods next the power are connected to either end of the power rack. The proper tension in rods is accomplished through turn buckles furnished in the rod lines.

In this operator the transmission line (the 1" pipe) is always in tension both when opening and closing the windows. For details, see Fenestra Page 72.

(SF) ELECTRICAL EQUIPMENT FOR OPERATORS—Specifications

Notes are explanatory or advisory only and need not be included in the specifications

(SF-1) Work Included

Note: List and locate. See Paragraph 13, Fenestra Page 2.

(SF-2) General

All Mechanical Operators, electrically controlled, shall be provided by the Operator Manufacturer, with complete electrical equipment, as hereinafter specified. The operator manufacturer shall provide complete wiring diagrams.

(SF-3) Electrical Equipment

(SF-3a) Motors—Motors shall be of type best adapted to the power equipment, of high torque and ample horsepower.

Note: Motors operating on 220 volt or 440 volt, 60 cycle, 3 phase alternating current are recommended. Direct current motors are not carried in stock, but if alternating current is not available, a special motor for 230 volt, direct current, can be supplied.

Note: Specify current furnished.

(SF-3b) Power Connections—Motors shall be connected to power by means of sprockets and chains, or direct connected through universal joints as best adapted to power requirements.

(SF-3c) Reversing Switches—Standard Magnetic Reversing Switches shall be enclosed in steel boxes and so designed, that the movement of the ventilator, either in opening or closing may be stopped or started at any point by manipulation of push buttons.

(SF-3d) Limit Switches—Limit Switches shall be positive in action and rigidly attached to the power to form an integral part of the power unit. All limit switches shall be enclosed,

yet accessible for adjustment so as to positively limit the motion of the ventilator in either direction.

(SF-3e) Push Button Stations—Push Button Stations "open," "close" and "stop" shall be of rugged construction to withstand hard usage. Buttons shall be recessed in cover so that they cannot be accidentally operated.

(SF-4) Electrical Construction

Note: The following provisions should be made in the Electrical Specifications.

The Electrical Contractor shall install magnetic reversing switches and push button stations and shall furnish and install safety type, line switches. He shall also furnish all conduit, fittings and wire and do all wiring in accordance with the wiring diagram between the Electrical Equipment furnished by the Window Operator Manufacturer and that furnished by himself.

All materials and workmanship shall meet the requirements of the National Electric Code and all Local and State Inspection Bureaus.

Conduit shall be galvanized or black enameled. Wire shall be rubber covered N. E. C. Exposed conduit shall be run in a systematic, slightly manner, parallel with structural features of the building and rigidly and neatly secured. Where walls are plastered, conduit shall be concealed.

The Electrical Contractor shall carry fire, workmen's compensation, and public liability insurance. He shall guarantee his work for a period of one year after completion. Defects in the work and material furnished by him, developing during the above named period shall be promptly and satisfactorily made good at his expense.

(V) SWINGING AND SLIDING STEEL DOORS—Specifications

Notes are explanatory or advisory only and need not be included in the specifications.

Note: Both Channel and Tubular doors are made to swing or slide in single and double units. Specify as required.

(V-1) Work Included

Note: List and locate. See Paragraph 13, Fenestra Page 2.

Note: In lists or schedules, indicate whether swing doors open "In" or "Out" and which jamb carries the hinges.

(V-2) General

All doors shall be *Fenestra* (Channel) (Tubular) Steel Doors as manufactured by DETROIT STEEL PRODUCTS COMPANY.

Note: Specify whether Channel, Tubular or both.

(V-3) Materials

(V-3a) Door Frames, etc.—

Note: We strongly recommend that all door frames be included with the Miscellaneous Structural Steel or Ornamental Iron and that they be included under these or similar other specification divisions, for the reason that the frames in all cases should be installed when the building is erected to assure rigid anchorage. Steel doors, on the contrary, should be installed only after the building is erected.

Note: Provide, therefore, that all frames shall be made to the exact dimensions furnished by the Door Manufacturer and that they shall be erected plumb, true and rigidly anchored. Include provisions for slotted, sliding door thresholds and supports for sliding door tracks where these are required.

Note: Where particularly desired, 4" channel frames for swing doors only, will be furnished with the doors at added cost. If required, so specify. (See Fenestra Page 75.)

(V-3b) Door Panels—All sections shall be specially designed, hot rolled, solid steel bars with heavy fillets in all re-entrant angles.

All panel frame members shall be (equal leg channel) (angle) sections.

Note: Channels are used for channel doors and angles for tubular doors. Include either or both as required.

Muntins shall be 1½" deep. Solid panels shall be of 13 gauge steel.

(V-3c) Door Stiles and Rails—

(1) Door stiles and rails shall be of heavy rolled steel channels.

(2) Door stiles and rails shall be of heavy square steel tubing.

Note: Specify either or both as required.

(V-3d) Sliding Door Closure and Guide Plates and Meeting Stile Astragals—Closures and guides (and meeting stile astragals) shall be of heavy steel plates.

(V-4) Construction

(V-4a) Door Panels—All panel frames shall be mortise and tenon, air hammer riveted, at all corners. Muntins shall be continuous from bottom to top and from side to side, so interlocked at intersections as to increase the rigidity and strength—joints at frames shall be mortise and tenon air hammer riveted. Solid panels shall be secured by angles riveted to the panel frame and muntin members.

(V-4b) Channel Doors—Channel stiles and rails shall be butted together over solid corner castings, through riveted with countersunk rivets. Stiles and rails shall be riveted to frame of panel. Door stiles shall be reinforced with a steel plate at butts.

(V-4c) Tubular Doors—Tubular stiles and rails shall be mitered and butt welded at corners. Panel frames shall be attached to stiles and rails with countersunk machine screws.

(V-4d) Closures—Closure plates at top and back edges of sliding doors shall be attached with countersunk machine screws.

(V-4e) Guides and Astragals—Guide (and astragal) plates on the face of sliding doors shall be attached with countersunk through rivets.

(V-4f) Glazing Angles—All glass shall be secured with glazing angles, neatly mitered at angles. Angles shall be secured to frames with brass machine screws and to muntins with machine screws and nuts.

(V-4g) Hardware Provisions—Stiles, where required, shall be tapped to receive hardware attached at the time of erection.

(V-5) Attached Hardware

Note: Attached at factory.

(V-5a) Butts—All swinging doors shall be equipped with standard (4½"x4½") (6"x4½") steel butts with non-risable loose pins. The number of butts to each door shall be such as to adequately carry the weight.

Note: 4½"x4½" butts are used on channel doors, 6"x4½" on tubular doors. Include either or both as required.

(V-5b) Latch-and-Locks—All swinging single doors shall be equipped with standard, bronze face, mortise latch-and-locks.

Swinging and Sliding Door Hardware

FENESTRA PAGE 73 (SEE PLATES ON PAGES 75, 76, 77)

Note: Cylinders are installed after erection.

Note: Omit if surface Japanned iron latch and strike are selected. See (V-6b).

(V-5c) Sliding Door Handles—All sliding doors shall be equipped with combination flush and projecting iron handles, one to each door, solidly riveted to the steel panels.

(V-6) Detached Hardware

Note: See Fenestra Page 73.

Note: All detached hardware shall be shipped carefully packed to prevent damage till applied for use.

(V-6a) Swing Door Cylinders and Handles—All swing doors shall be equipped with malleable iron handles, and bronze faced cylinders and escutcheons.

Note: Use when latch-and-locks are included, see (V-5b). Where master keying is necessary, we prefer to key to our own system. If cylinder master keying is required, so specify here.

(V-6b) Swing Door Latches—All swinging doors shall be equipped with surface, Japanned iron door latches and strikes.

Note: Omit if mortised latch-and-locks are selected. See (V-5b) and (V-6a).

(V-6c) Shot Bolts—All fixed leaves of double swing doors shall be equipped with standard surface, spring shot bolts (Japanned iron case and steel bolts). Top bolt shall be chain operated. Bottom bolt shall be foot operated.

(V-6d) Sliding Door Hasps—All sliding doors shall be equipped with hinged hasps and staples.

(V-6e) Sliding Door Tracks—All sliding doors shall be equipped with standard steel tracks and adjustable roller bearing trucks, complete with track brackets.

(V-6f) Special Hardware—

Note: Special hardware, such as standard fire exit panic bolts, standard door checks, etc., will be furnished where desired. If required, so specify.

(Y) INTERCHANGEABLE INDUSTRIAL PARTITIONS—Specifications

Notes are explanatory or advisory only and need not be included in the specifications.

Note: These partitions are adapted for use in warehouses, factories, mills, garages and the office portions of industrial buildings.

Note: To avoid repetition, where these specifications are identical to those for channel and tubular steel doors, this is so noted.

(Y-1) Work Included

Note: List and locate. (See Paragraph 13, Fenestra Page 1.)

(Y-2) General

All steel Industrial Partitions shall be Fenestra as manufactured by the DETROIT STEEL PRODUCTS COMPANY.

(Y-3) Material

(Y-3a) Window Units—All sections shall be specially designed, hot rolled, solid steel bars with heavy fillets in all re-entrant angles.

All frame members shall be equal leg channel sections. Muntins shall be 1½" deep.

(Y-3b) Mullions and Door Frames—Each mullion shall be made of two 16 gauge formed steel plates, interlocked and punched for connections. Furnish malleable iron shoes for floor, ceiling and door head jamb connections. Door mullion shall be provided with butt reinforcing plates. Door head jambs shall be similar to mullions.

(Y-3c) Partition Ties—Partition Ties at top of window units shall be of 16 gauge formed steel plates, punched for mullion connections.

(Y-3d) Base Plates—Base plates shall be of 14 gauge steel.

(Y-3e) Filler Plates—Filler plates shall be of 24 gauge steel.

(Y-3f) Doors—Doors shall be formed with panels of window unit sections with special heavy rolled steel U channel stiles and rails. Glass shall be secured by glazing angles.

(Y-3g) Miscellaneous—Furnish all bolts, tap screws, etc., for connecting mullions and windows and door units together. Furnish angles or other means of attaching filler plates to building construction. Furnish expansion bolts where required.

(Y-4) Construction

(Y-4a) Window Units—All frames shall be mortise and tenon, air hammer riveted, at all corners. Muntins shall be continuous from head to sill and from jamb to jamb, so interlocked at intersections as to increase the rigidity and strength. Joints at frames shall be mortise and tenon air hammer riveted. Base plates shall be secured by angles riveted to the plate, frame and muntin members.

(V-7) Erection

(V-7a) All Steel Doors shall be erected by the FENESTRA CONSTRUCTION COMPANY under a separate contract.

Note: See Paragraph 5, Fenestra Page 1.

(V-7b) All doors shall be erected in a thoroughly workmanlike manner and left in perfect operating condition.

(V-7c) Apply all hardware in accordance with the manufacturer's directions.

(V-8) Painting

All Fenestra Steel Doors shall be given one dip-coat of red mineral paint by the manufacturer before shipment.

Note: The following should be provided for in the Painting Specifications:

One additional coat of paint should be applied after erection before glazing. Further painting should be deferred until at least three weeks after glazing to allow putty to set. One or more additional coats may then be applied as required.

Note: Where desired, the FENESTRA CONSTRUCTION COMPANY (see Paragraph 5, Fenestra Page 1) at reasonable added cost will do field painting after erection. If required, so specify here, including specification for paint and its application.

(V-9) Glass and Glazing

Note: The following should be included in the Glazing Specifications. See Paragraph 10, Fenestra Page 2.

(V-9a) Glass—Glass shall be ¼" thick, rough wire.

(V-9b) Putty—Putty shall be a high grade of steel window putty.

Note: Ordinary wood sash putty must not be used. See Paragraph 11, Fenestra Page 2.

(V-9c) Glazing—All glass shall be bedded in putty and secured with glazing angles.

Note: Do not paint until putty has thoroughly hardened. See note Paragraph (V-8).

(Y-4b) Doors—Door panels shall be constructed like window units.

Note: Same as (V-4b).

(Y-5) Door Hardware

Note: Same as (V-5a), (V-5b), (V-6a), (V-6f) as applied to channel doors.

(Y-6) Erection

All steel Industrial Partitions shall be erected plumb and true, properly aligned and securely attached to the building construction. (Complete with all filler plates required.)

Note: If metal lath and plaster is substituted for filler plates, include this provision in the Lathing and Plastering Specifications.

Note: By loosening two mullions, any window unit may be removed or inserted without disturbing the rest of the partition. Units containing doors may be substituted for window units, or vice versa.

Apply door hardware in accordance with manufacturer's directions.

Note: Units which contain doors are shipped "knocked down." In erecting door units, doors must always be hung from the mullion, which is reinforced to receive the butt screws.

Note: Where desired, the FENESTRA CONSTRUCTION COMPANY (see Paragraph 5, Fenestra Page 1) at reasonable added cost will erect steel Industrial Partitions. If required, so specify here.

(Y-7) Painting

Note: Same as (V-8).

(Y-8) Glass and Glazing

Note: The following should be included in the Glazing Specifications. (See Paragraph 10, Fenestra Page 2.)

Glass—Glass shall be ¼" thick plate (double strength).

Note: Single strength glass is not recommended.

Putty—Putty shall be a high grade of steel window putty.

Note: Ordinary wood sash putty must not be used. See Paragraph 11, Fenestra Page 2.

Glazing—All glass in window units shall be set in a bed of putty and secured by copper plated, steel, spring glazing clips furnished by the Partition Manufacturer. (4 clips for each light.) Face putty shall be applied in a neat, clean-cut, smooth manner.

Glass in doors shall be bedded in putty and secured with glazing angles.

Note: Do not paint until putty has thoroughly hardened. See note Paragraph (V-8).

• STANDARD • AND • STOCK • TYPES •
TYPES SHOWN SHADED ARE CARRIED IN STOCK

NOTE - THE ABOVE UNITS WILL BE MADE WITH CHANNEL TRIM AND CAN BE USED FOR EITHER SWING OR SLIDING DOORS.

DIMENSIONS SHOWN ARE OVERALL DOOR SIZES WITH OPENING CLEARANCES DEDUCTED. FOR CLEARANCES SEE PLATE NO. V-102.

• ELEVATION • OF • TYPICAL • DOOR • FRAME •

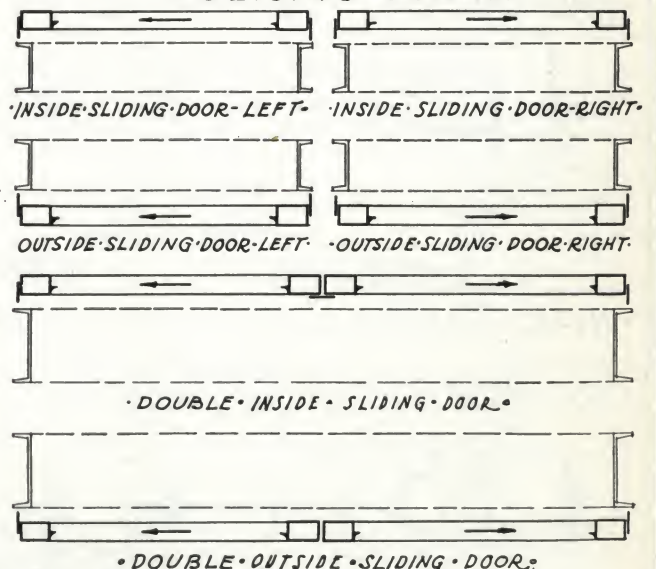

NOTE - STANDARD DOOR FRAMES FOR SWING DOORS ONLY ARE MADE OF 4" STRUCTURAL STEEL CHANNEL AND ARE EQUIPPED WITH HEAVY ZEE ANCHORS ON EACH SIDE SPACED ABOUT 2'-0" ON CENTERS TO ANCHOR FRAME INTO THE MASONRY. HOLES IN FRAME FOR HINGES ARE DRILLED AND TAPPED IN SHOP TO MATCH DOORS.

FRAMES FOR SINGLE DOORS ARE SHIPPED ASSEMBLED, USING AN ANGLE TIE ACROSS THE BOTTOM. FRAMES FOR DOUBLE DOORS ARE SHIPPED KNOCKED DOWN AND MUST BE BOLTED TOGETHER IN FIELD.

Airplane Hangar Doors

Fenestra Airplane Hangar Doors offer a quick, easy and simple method of opening or closing large door openings.

Stiles and rails are made from hot-drawn 4x2½ in. seamless, steel tubing, and are mitered, butt welded and heavily reinforced at every corner. Special Fenestra, hot rolled, solid steel sections are used to frame the glass panels, glass being held by bed putty and glazing angles. Solid panels are of 11-gauge steel, and are double—one on each side.

All doors rest on double flanged, cast steel wheels designed to roll on steel tracks which carry the entire weight of the doors. Each wheel is mounted in a cast steel housing equipped with a roller swivel and ball bearings.

Bronze bushed steel rollers, attached to the head rail of each door, serve as guides, reduce friction and minimize the transverse load on structural steel members.

Suitable locking hardware, such as cane bolts, etc., is supplied and, to make manual operation easy, a hand hole is recessed into each door panel. Weathering is accomplished by means of ½x4½ in. rubber strips between doors.

Due to shipping limitations, the usual dimensions of these doors are 8x20 ft. but other sizes can be made as specified. Any number of doors can be used on parallel tracks approximately 6 in. apart to fill any width of opening.

Hinged pilot doors can be supplied when specified. As with other Fenestra products, erection and field painting will be handled by FENESTRA CONSTRUCTION COMPANY under separate contract, at reasonable added cost. Sixty-four of these doors, installed in 1926 at the Ford Airport, Fordson, Michigan, have been the subject of admiring comment on the part of aviators on account of their unusually easy operation.

Super-Power Operator

For exceptionally large industrial buildings where unusual operating service is desired on long runs of continuous top hung windows, we are prepared to supply the Fenestra Super-power which, in connection with con-

The Fenestra Super-Power Operator

tinuous operator transmission line and lever arms, will handle conveniently top hung continuous windows in runs up to 600 ft.

The utmost care has been used both in workmanship and materials to produce a device that combines smooth, even, efficient action with superlative strength and durability.

The power consists of a heavy, double, spur gear reduction of especially heat treated alloy steel and a case hardened steel worm engaging a heavy, special alloy, non-ferrous bronze, worm gear. Shafts for all spur gears are of heat treated alloy steel with generously proportioned bearings. The worm shaft has, in addition, combination radial and thrust bearings of ball bearing

type. The entire mechanism is enclosed in an accurately machined oil-tight case.

The power is usually located in the center of the run, operating a transmission line on either side through a heavy, continuous, roller type, chain drive. The motor is direct connected to the power by means of spur gears.

Conditions demanding the use of this super equipment are unusual. We strongly recommend consultation with Fenestra engineers who will be glad to make suggestions without obligation.

Underwriters' Windows

In most buildings, standard Fenestra steel windows afford ample fire protection. Under certain conditions, however, types carrying the label of the Underwriters' Laboratories, Inc., are desirable or required.

Underwriters' windows are limited to 7x12 ft., either dimension being taken as height or width.

Multiple units may be used to any width of opening by the use of the standard Fenestra T-bar mullion between units, provided the width between mullions does not exceed 7 ft.

¼ in. wire glass must be used, each light being limited in width to 14 in. and in height to 48 ft. and an exposed area of 350 sq. in. Glass to be held by ⅝x⅞ in. 16-gauge, pressed steel angles tapped to outside ventilator bars and bolted through interior muntins. Exposed glass area is measured from toe to toe of the glazing angles.

At added cost, the following types of Fenestra windows can be furnished with the Underwriters' label:

Standard and listed special types of horizontally pivoted windows (see Fenestra page 38) pivoted either 2 in. above center or 4 in. from the top.

Standard and listed special types of commercial projected windows (see Fenestra page 28) except those types which contain one or more open-in ventilators.

Standard and listed special types of architectural projected windows (see Fenestra page 20) by insertion of muntin bars in ventilators as necessary to meet glass limitations—except those types which include one or more open-in ventilators.

Counterbalanced windows, by the insertion of vertical and horizontal muntins in ventilators as necessary to meet glass limitations. All ventilators are limited in area to 30 sq. ft.

Each horizontally pivoted ventilator must be operated separately, either with standard cam handle and stay or cam handle and chain except those pivoted 4 in. from the top where cam and stay must be used. Standard Fenestra iron hardware on projected and counterbalanced types will be satisfactory.

Power and Auxiliary Power

The Fenestra Power and Auxiliary Power are designed for use on any tension operator where it is desired to operate several banks or runs of sash, one above another, from the same power station. Naturally it is used chiefly with continuous operator and is equally applicable to either manual or electrical control.

The device consists of a steel pinion which moves with the main power and which is connected through a steel shaft with universal joints, to a similar pinion in mesh with a rack on each of the other runs of windows. Thus the several pinions move in unison causing the tension lines on the various runs to act simultaneously.

The width of opening and the number and length of runs naturally vary with the requirements of the job.

Special Door Designs

Occasionally we are asked to solve some special door problem which arises in connection with buildings of unusual or peculiar design and our engineers are always glad to co-operate on such requests.

A typical example of this service was the design and manufacture of 20 Fenestra vertically sliding doors for the Detroit Seamless Steel Tube Company. These doors were operated by a worm and gear device connected by means of a steel shaft to pulleys over which the doors were counterbalanced against counter-weights.

STEEL & BRONZE WINDOWS

suitable for Residences, Universities, Colleges, Public Buildings, Schools, etc.

SECTIONS as illustrated full size, based upon over 100 years' experience, provide two points of contact, with ample interior cavity to prevent capillary attraction. This system has proved weathertight in the most exposed situations throughout the world. These three sections are of universal application, and can be made to open outwards, inwards, or to pivot horizontally or vertically. We recommend as a general rule that casements should open outwards.

GLAZING & SETTING

We keep a staff of fully qualified workmen, and undertake contracts including setting and glazing complete.

HARDWARE. Our hardware is of the highest class, made from BRONZE to U.S.A. Naval Specification, all working parts machined with ample bearing surfaces for everlasting wear. All hinges are of solid bronze, and horizontally and vertically pivoted casements are hung on our patent solid bronze cup pivots, which afford perfect security, easy working and exclusion of the weather.

QUALITY. We make three qualities: No. 1 fitted with Hope's bronze hardware; No. 2 with iron hardware (the steel for both these qualities is finished with two coats of anti-corrosive paint); Quality No. 1A is finished with a stoved coat of enamel in addition.

FOR THE HIGHEST CLASS OF WORK WE RECOMMEND THE USE OF SOLID BRONZE. IT IS EVERLASTING IN WEAR, HAS A BEAUTIFUL SURFACE, AND IMPROVES IN COLOUR WITH AGE. WE MAKE ALL OUR SECTIONS IN THIS METAL, AND WILL FURNISH SAMPLES AND ESTIMATE OF THE COST WHEN DESIRED.

SECTION 23

SECTION 22

SECTION 21

HOPE'S FRENCH WINDOWS

HOPE'S STANDARD FRENCH WINDOWS ARE 6' 10" HIGH \times 3' 4 $\frac{1}{4}$ " WIDE, AND ARE NOW FITTED WITH A SOLID BRONZE CREMORNE BOLT TO OPERATE FROM BOTH SIDES AND TO LOCK FROM THE INSIDE. THE PANES ARE THE SAME SIZE AS IN OUR STANDARD WINDOWS, SO THAT WITH A PROPER ADJUSTMENT OF CILL LEVELS HORIZONTAL BARS WILL RANGE WITH EACH OTHER. THESE WINDOWS ARE COMPLETE IN EVERY RESPECT AND ARE STOCKED IN NEW YORK.

HOPE'S STANDARD STEEL WINDOWS

When ordering state which hand the casements are to be hinged. A right hand casement has the hinges on the right looking from inside.

All casements are side hung to open out except the "T" type ventilators, which are hung at top to push out. All these windows can be coupled with vertical 1 mullions.

Diagram labels include: T.1, T.1 [WITHOUT PANES], T.4, T.4 [WITHOUT PANES], T.2, T.44, T.5, T.3, T.444, V.1, V.1 [WITHOUT PANES], V.9, V.9 [WITHOUT PANES], V.2, V.22, V.4, N.9, N.1, V.5, V.5 [WITHOUT PANES], V.10, V.10 [WITHOUT PANES], V.6, V.66, V.8, N.10, N.5, V.15, V.11, V.12, V.13, V.14, V.1T.1, V.1T.4, V.9T.1, V.9T.4, V.2T.2, V.2T.4, V.4T.3, V.4T.4, V.2T.4, V.5T.1, V.5T.4, V.10T.1, V.10T.4, V.6T.2, V.6T.4, V.8T.3, V.8T.4, V.66T.4, and two 'APARTMENT HOUSE WINDOW' diagrams.

KEWANEE MANUFACTURING COMPANY

Basement Coal Chutes, Basement Windows and Building Specialties

85 North Tremont Street, KEWANEE, ILL.

Nationally distributed through Dealers in Building Material, Hardware and Structural Steel

Product

Kewanee Copper Steel Basement Windows.
For Kewanee Coal Chutes, see pages A614-615.

Kewanee Copper Steel Basement Windows

Old or new basements may be materially improved by the use of Kewanee Copper Steel Basement Windows, which will transform the basement into a big, light, airy room, readily utilized for laundry, workshop, playroom and many other purposes.

In remodeling a great opportunity is offered to modernize with Kewanee Windows. They are suitable not only for use in basements, but also for garages and a variety of other small buildings. Architects, builders and contractors recommend these improved Kewanee Copper Steel Windows because of their marked advantages.

Durable and Attractive—The strong, compact and efficient steel sections employed in Kewanee Windows admit 50% to 75% more light and air (depending upon the size of the wall opening) than the bulky wood frame and sash. Their trim, clean-cut lines add greatly to the appearance of the basement.

The Kewanee one-piece frame insures absolute rigidity with no possibility of distortion. Constructed of rust resisting Copper Steel, Kewanee Windows are rotproof, fireproof, windproof, dustproof and verminproof, and in every way more durable than wood windows. Experts recommend steel basement windows instead of wood because of the protection they provide against the ravages of termites, or white ants.

Efficient and Convenient—Kewanee Windows open easily and lock securely. They never warp, bind or rattle. When closed, the hanger-hinge at the top and the cam-action lock at the bottom draw the sash and frame tightly together, all around, in a broad flat contact. This construction, in connection with the drip bar projecting over the bottom edge of the frame, makes Kewanee Windows exceptionally weatherproof. When closed, the sash is firmly held in place by the hanger-hinge, but when swung open into the horizontal position it is readily lifted out for cleaning.

Furnished Complete—

Kewanee Windows are shipped from the factory with sash in frame, hardware attached, all coated with best metallic paint, and completely assembled in every detail (except glazing), ready to set in the openings without further preparation or fitting. The clips needed for glazing are included with each window. Screw holes in frame permit

screens to be readily attached.

Easily Installed—Kewance Windows are readily installed in any kind of construction. (Details of typical installations are shown below.) The sash, hinges and lock are contained entirely within the horizontal flange of the frame, which affords the workman a clean, definite masonry guide on all sides, that he can build up to without obstructions of any kind. He is not called upon to exercise any judgment as to the amount of clearance he should

allow in order to insure a sightly job and free operation of the sash.

Low Cost—Standardization and quantity production have greatly reduced the cost of manufacture, so that you may now obtain Kewanee Copper Steel Windows at the same cost—installed—as wood windows.

Inside View

Details show: convenient hanger-hinge that allows removal of sash; overhanging drip bar; strong, rigid, one-piece frame requiring no riveting or welding; compact cam-action lock

LUNDELL-ECKBERG MANUFACTURING CO., INC.

"Lemco" Steel Casements and Hardware for Wood and Steel Casements
JAMESTOWN, N. Y.

"Lemco" Standard Casements

Materials and Construction—All Lemco casements are made from hot rolled steel sections and bars are carefully straightened.

All corners are accurately mitered and electrically welded together, making a strong and neatly finished casement.

All surfaces are thoroughly cleaned from rust and scale and given one coat of gray enamel which is baked on; this prepares the casement for the final coat to be applied after glazing.

Weatherproof Construction—Lemco construction provides two-point weathering contact throughout, and casements, if properly erected, are guaranteed to be absolutely weatherproof.

Hardware—All standard casements are equipped throughout with solid bronze or brass hardware. Single casements are hung on Lemco Patented Safety Cleaning Hinges which permit the cleaning of the exterior of the glass from inside the room. These hinges also have a friction pivot feature which holds the sash in any desired position and eliminates the use of adjusters.

Lupton Heavy Casements

Made side hinged, double or single, opening out and opening in; top hung, opening out; vertically pivoted; horizontal-pivoted; projected.

All hardware is of bronze and combines refinement of design with abundant strength. Half-size sections are shown at lower left and details below.

Heavy Casement Sections—Half Full Size

Section 320—Frame member of all casements having hinged, pivoted or projected ventilator. Section 322—Top, bottom and side rail of all outward opening casements. Section 353—Muntin. Section 102—Mullion and transom bar for smaller multiple casements. Section 116—Mullion and transom bar for larger multiple casements. Section 303—Frame member of all stationary windows. Section 314—Vertical mullion. Section 356—Meeting Rail. Inside frame member where two ventilating sections occur. Sections 377 and 378—Glazing beads. No. 378 is extruded bronze, furnished on specification only

Lupton Residence Casement Windows

Members are specially rolled from high carbon copper-bearing steel, with the corner joints of all frames and ventilators solidly welded. Muntins are riveted into

frame members and have locked joints at intersections.

Side hinged casements have malleable iron window cleaning (extended) hinges; top hinged transoms and standard one-light wide side hinged windows have close-up hinge of similar design. Hinges are riveted to frames and ventilators.

The side hinged type are equipped with malleable iron locking handle, bronze keeper and steel stay bar adjuster with tapered brass peg to prevent rattling. Bronze hardware of attractive design furnished when specified. All hardware is shipped attached.

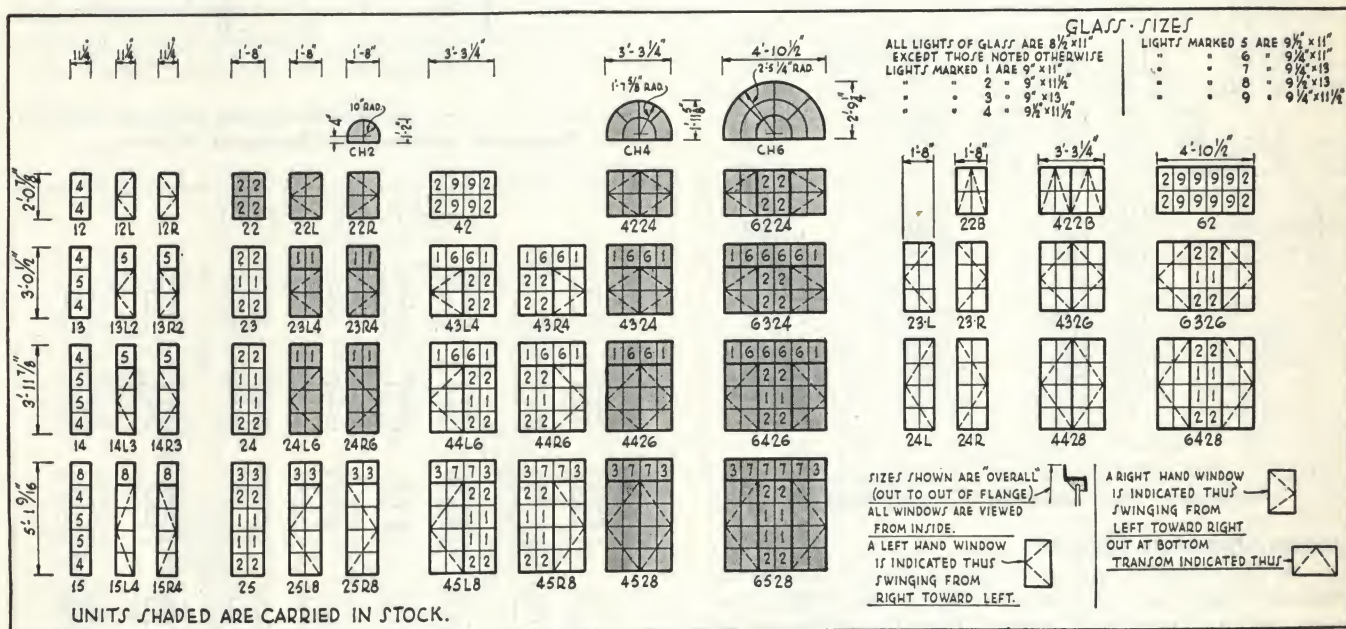

Diagram below shows standard and warehouse stock sizes. Stock sizes are shaded.

General details are shown at left.

Calking—Space between casements and opening should be calked with Lupton Elastic Pointing Cement furnished with all windows. Where horizontal imposts and vertical mullions occur, the frame members and impost bar should be buttered with Lupton Elastic Pointing Cement (detail at left).

Typical Wall Details

Warehouse Stock and Standard Sizes Residence Casement Windows

Lupton Basement Windows

Sections are copper-bearing steel, with the corners stoutly welded, not bent. A solid steel drip at the bottom adds to the weathertightness of the windows. Five standard sizes, all 100% ventilated and hinged at top, available for immediate deliveries.

Three lights wide, 10x12-in. glass (2'9 3/4" x 1'3"); three lights wide, 10x20-in. glass (2'9 3/4" x 1'11"); three lights wide, 12x18-in. glass (3'3 3/4" x 1'9"); two lights wide, 14x20-in. glass (2'7 3/8" x 1'11"); and a Security Type, 8 small glass lights (2'7 3/8" x 1'11"). Dimensions are overall.

Lupton Pivoted Windows

For sidewalls of all types of industrial buildings. Members are low carbon steel, designed for necessary strength without needless weight.

Diagram below shows Lupton warehouse stock sizes, most used sizes of stationary and pivoted windows, in 14x20-in. and 12x18-in. glass sizes. They are strictly standard in construction and are carried in stock completely assembled.

Warehouse Stock Sizes of Pivoted Windows

Lupton Operating Device

A high grade torsion device designed to operate medium length runs of center pivoted sidewall steel windows and top hung and bottom hinged wood windows. Two sizes are carried in stock. Details furnished on request.

Lupton Rolled Steel Skylight

Especially adapted to conditions of unusual severity, such as vibration, wide range of temperature and inaccessibility for frequent painting. Details and literature on request.

Lupton Projected Windows

In this type of window, the ventilators project in or out rather than pivot.

The Architectural Type calls for larger glass lights and is furnished with glazing angles.

In the Commercial Type, glass sizes conform to those used in Lupton Pivoted Windows.

Ventilators remain open in any position without locking, the movement of the friction shoe insuring an adjustment for this purpose.

Screens and shades are easy to apply; we furnish neither but will be glad to offer our suggestions.

Sizes and details of Architectural Type are given below.

Sizes of Architectural Projected Windows

Pond Continuous Windows

Solidly welded top hung steel windows, which can be joined together to make runs of practically any length. Standard heights: 3, 4, 5 and 6 ft.; standard lengths, 20 ft.

They are used in Pond Roof Designs, permitting free elimination of gases and heavy air, and need not be closed for storms. They can also be used in lower side-walls, monitors and sawtooth roofs.

Details of Pond Continuous Windows Shown on Slope

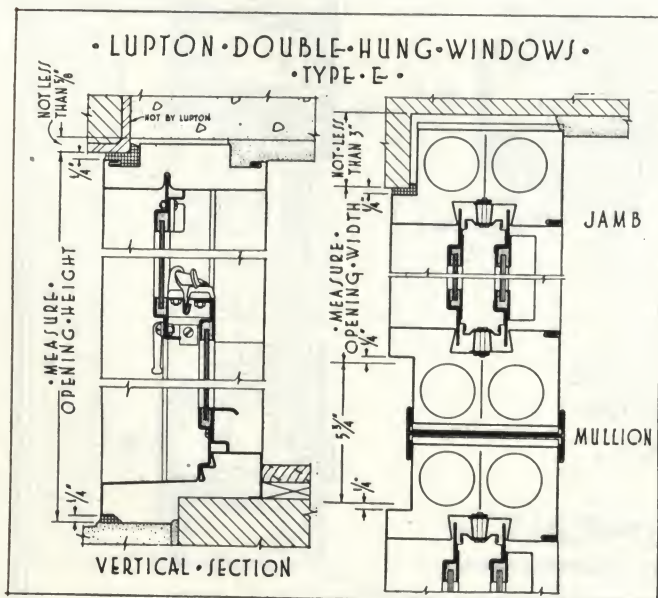

Through the abundant light and ventilation afforded by these windows, shop conditions are made ideal for large groups of workers. Costly turnover is consequently avoided, effecting considerable savings to the employers.

Pond Operating Device

Designed on the principle of tension transmission, this device will satisfactorily control long lines of top hung windows, either vertical or sloping. Windows will securely lock in any position. Operation is either by hand chains or motors. Details and literature on request.

Lupton Double Hung Windows

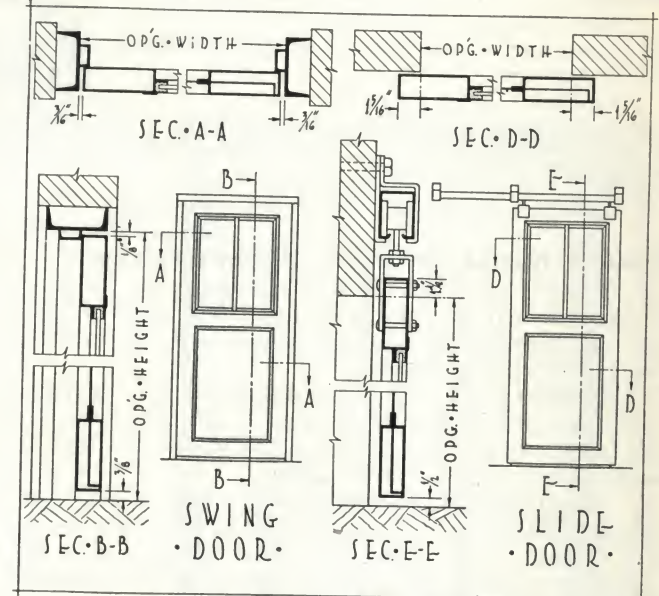

Made in forty standard sizes, in two types, E and F. Design of both is the same, the F Type being of heavier material than Type E. Details below.

Detail, Double Hung Window

Lupton Commercial Steel Doors

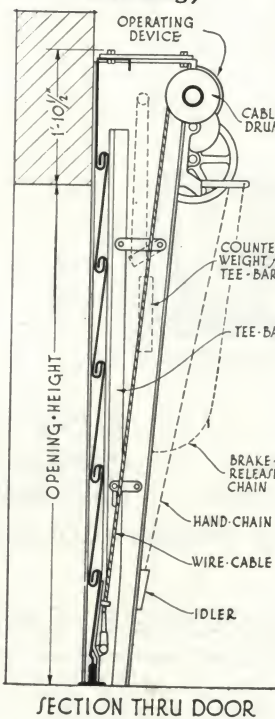

Lupton Commercial Steel Doors are made in hinged and sliding types. They are strongly built to stand hard wear and the accompanying hardware matches the doors in quality and service. Sizes as given are carried for immediate delivery. We also manufacture seamless tube doors used for inside and outside doors of factories, power houses, warehouses etc.

Burvett Vertical Lift Doors (Patented and Patents Pending)

A new design in door construction overcoming the limitations of rolling, sliding and hinged doors. Galvanized steel plates are raised and lowered in telescopic fashion. Heavy wire rope, which is attached to each side of the bottom leaf, runs over steel drums located on a horizontal shaft at the top. Doors are closed by gravity by simply releasing the brake. Operation is by hand chain or motor, each door being controlled independently. Standard design. Full details upon request.

THE McCOY BRONZE COMPANY, INC.

Architectural and Ornamental Bronze Work and Casements

Forsythe and Holden Streets, DETROIT, MICH.

Products

MONUMENTAL, ECCLESIASTICAL, ARCHITECTURAL and COMMERCIAL BRONZE WORK in all the branches.

Pyramid Bronze Casements.

Also Signs, Tablets and Letters; Castings furnished in bronze, brass, aluminum and alloy.

For Pyramid Bronze Doors, see pages A834-835.

Service

Estimates furnished from architects' plans and specifications.

Suggestions, designs or models will be furnished when desired. We solicit your inquiries.

Facilities

A complete modern plant manned with experienced and capable workmen.

Pyramid Bronze Casements (Patents Pending)

Suitable for all types of buildings, the Pyramid bronze casement is superior in durability, weathertightness and appearance. Sections shown will illustrate the many points of excellence.

Construction—Pyramid sash has six different standard extruded bronze members (extruded from our own dies) with a combination of which we are able to make up any form of bronze sash.

This construction, making for economy and uniformity, creates unbroken architectural lines both inside and outside. The glass mould and frame mould are applied in a novel manner, concealing and permanently retaining all putty.

Ornamental Bronze Work—Standard Units

Architects will be pleased to learn of the standardization of bronze counterscreens and store fronts for bank work, etc. We have a large collection of die shapes and special ornamentation. Many desired effects can be secured without cost of special tools and patterns. We will gladly send details of different standardized units.

STANDARD STEEL WINDOW CO., INC.

Solid Rolled Steel Casement Windows

WASHINGTON, D. C.

REPRESENTATIVES IN PRINCIPAL CITIES

Steel Casements and Leaded Glass in Standard Units and Sizes

STANWIN casements properly set are absolutely weathertight. They are of two-point flat contact solid rolled sections and are considerably heavier than the ordinary cottage casement.

STANWIN units can be assembled with one another into an almost limitless arrangement and thus provide windows in complete harmony with a wide variation of designs, and at the same time suitable in every respect to meet the most exacting weather conditions.

The hardware used on STANWIN casements is of substantial design and quality with all moving parts of solid bronze. The design of the hardware permits the installation and operation of insect screens and the full use of draperies and curtains for practical as well as decorative purposes.

The finish of STANWIN casements is two coats of oven baked gray enamel.

STANWIN casements, doors and leaded lights carried in stock for immediate delivery.

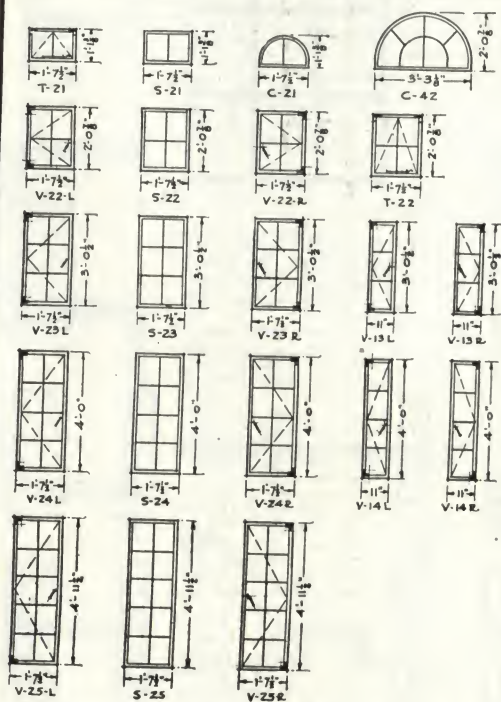

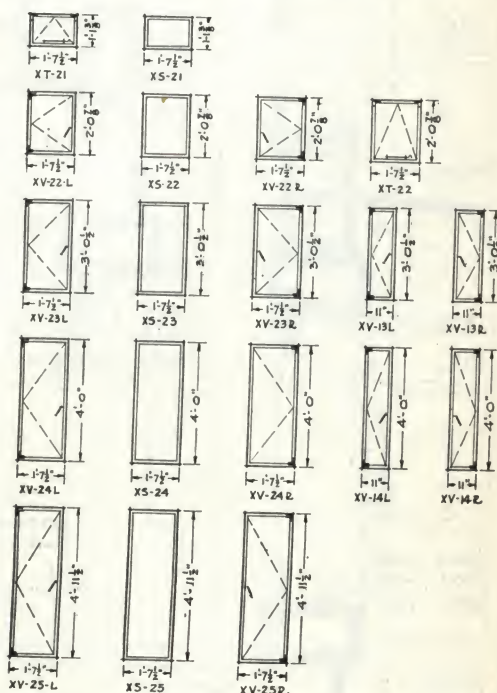

Illustration of Type XV-22L

Glazed with leaded glass
Construction, finish and hardware is typical for all units

All standard units both with and without steel muntins are carried in stock ready for assembly into the composite window. The windows are completely assembled and delivered to the job ready for installation.

Through the use of vertical T-mullions and horizontal transom bars, any of the STANWIN units either with or without muntins, may be combined to create windows of practically limitless combinations.

STEEL CASEMENTS IN STANDARD UNITS AND SIZES

Composite Windows of Stanwin Stock Units

The window illustrated below is one of the many possible combinations of STANWIN stock units.

This window is composed of the following: transom, 3 units type XS-22; sash, 2 units type XV-23L and 1 unit type XV-23R; 2 vertical mullions 5 lights high, and 1 transom bar 6 lights wide.

Any STANWIN units may be bolted together to make a composite window, through the use of the vertical mullions and transom bars, thus affording the architect practically an unlimited arrangement in the selection of a window best suited for any particular purpose.

One-half size mullion and transom bar details are shown adjoining. Regardless of the total height or width of a composite window the mullions and transom bars are both continuous from jamb to jamb, or head to sill.

Assembling is completed in our warehouse, hardware is attached and the entire window is shipped as one piece, ready for installation.

It is often desirable to hinge all vents on the same side, or provide more or less ventilation and special requirements as to the location of the ventilating sections are all easily met

through the use of STANWIN stock units.

The dimensions of the composite windows are determined by adding $\frac{1}{8}$ in. for each vertical mullion to the total width of the units, and similarly the height is determined by adding the height of the units plus $\frac{1}{8}$ in. for each transom bar. For example, the window illustrated above is figured as follows:

Width: 3 units at $1'7\frac{1}{2}"$ — $4'10\frac{1}{2}"$	Height: 1 Transom at $2'0\frac{7}{8}"$ — $2'0\frac{7}{8}"$
2 mullions at $\frac{1}{8}"$ — $\frac{1}{8}"$	1 Sash at $3'0\frac{1}{2}"$ — $3'0\frac{1}{2}"$
	1 Transom bar at $\frac{1}{8}"$ — $\frac{1}{8}"$
Total width $4'10\frac{1}{4}"$	Total height $5'1\frac{1}{2}"$

Stanwin French Casement Doors

These doors include four standard units, being doors and sidelights for same.

D-21 and SL-11 are arranged for single lights or leaded glass while D-46 and SL-26 have steel muntins which harmonize with

and provide glass sizes similar to STANWIN stock casement units.

Not only is it possible to combine the doors with STANWIN sidelights, but through the same ingenious arrangement of mullions and transom bars, STANWIN stock window units can be used for transoms and sidelights in almost endless combinations.

This enables the architect to obtain the utility of the door in openings of various sizes to meet his requirements and still avoid costly special construction.

These doors are very well adapted for use as terrace or balcony openings, and are

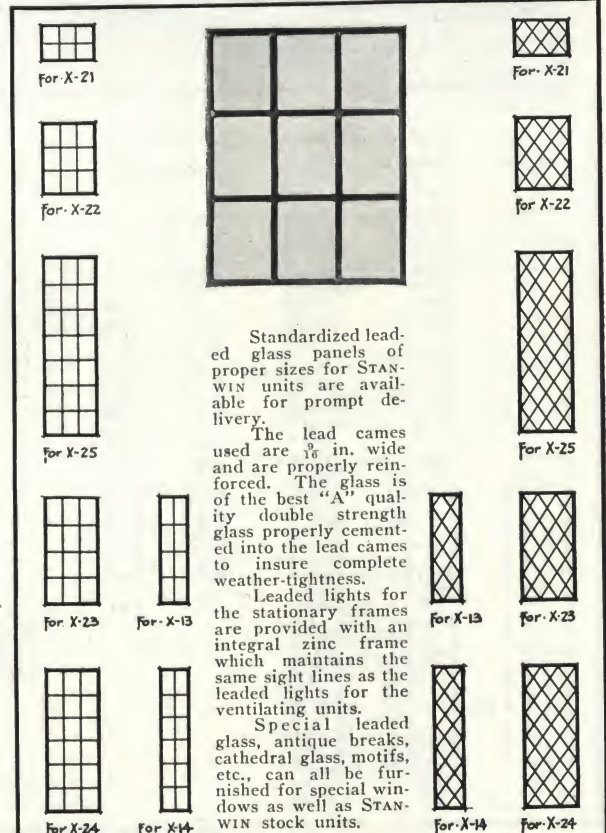

Stanwin French Casement Doors

Equipped with five knuckle bronze hinges, bronze slide bar adjusters at head, bronze cremone bolt, bronze threshold and bronze weatherstrip at sill

often used with good artistic results for interior openings. The locking is accomplished from inside only, and the doors cannot be used for entrance purposes.

1/2 F-S-Details of Stanwin Casement Windows

Leaded Glass in Standard Types and Sizes

Steel Casements in Special Sizes and Designs

Uses—For banks, office buildings, public buildings, churches, clubs, schools, universities, hospitals, etc.

Construction—Constructed of special rolled steel flat two-point contact sections of either heavy series 400 sections, or medium series 350 sections, process straightened, corners mitered and welded. Hardware attachment plates welded direct to casement sections. Sash fitted with solid rolled steel glazing beads on interior of sash (or arranged for exterior putty glazing).

Painting—All steel parts to receive one coat of rust resisting paint, and one coat of gray enamel, each coat separately baked on.

Hardware—Hardware of heavy design solid bronze of Government specification mixture, with dark coinage color.

Ventilators—Ventilated units arranged to open in or out; side, top or bottom hinged; vertically or horizontally pivoted; or projected. Doors fitted with double steel kick plates and bronze thresholds.

Subframes—Subframes of No. 12 gauge pressed steel designed to be built into the masonry, and allowing the installation of the casements after the rough work is completed in the building.

Operators—Mechanical sash operators controlling individual ventilators or in groups furnished for sash to operate from floor.

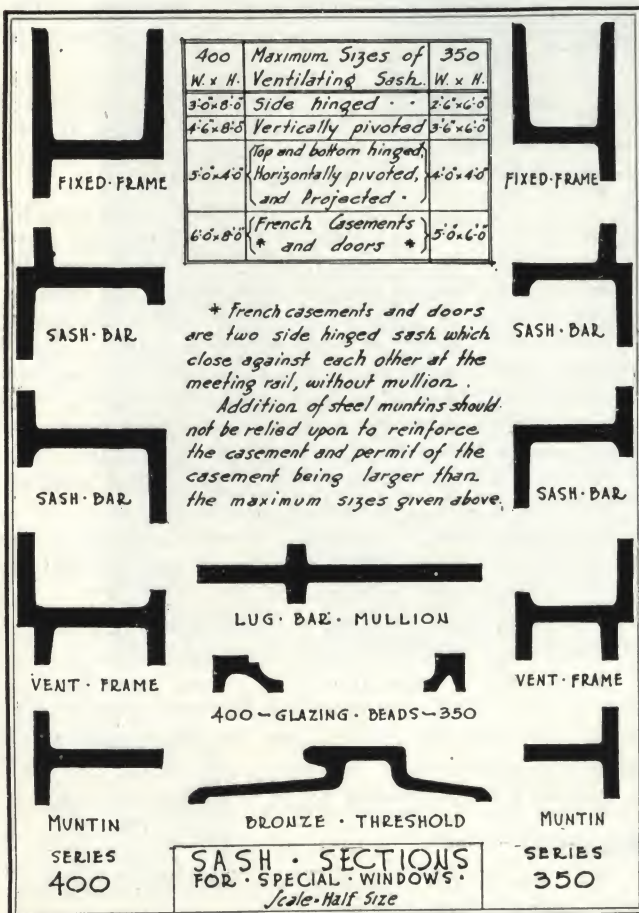

Erection—Erection is included in our contracts. We maintain a staff of experienced mechanics to do this work.

RICHEY, BROWNE & DONALD, INC.

2101 Flushing Avenue
MASPETH, CITY OF NEW YORK

AGENTS IN PRINCIPAL CITIES

Products

BROWNE FIREPROOF, WEATHERPROOF and DUST-PROOF WINDOWS.

Browne Windows

Browne windows are of solid steel, built on principles that produce positive results in operation and in overcoming air leakage. The windows may be in groups of one or more pair of sash as desired.

Also made in bronze.

Browne Fire Windows

—Same in general appearance, and bearing labels of Underwriters' Laboratories, Inc.

General Description

Frames and sash are of solid rolled steel. Sash are firmly hinged together to open (outwardly) and shut under symmetrical control of hinged arms attached to a stationary vertical bar. Arms are forged steel and afford absolutely rigid support. A simple catch lock fastens sash when window is closed.

Heavy felt weatherstripping is an integral part of the construction.

Every window is assembled at factory, tested for accuracy and shipped a complete unit including hardware and weatherstrips. Browne windows require no special skill for setting and are readily glazed after installation.

Glass—Should be furnished and set by glazing contractor and may be of grade or type desired.

Painting—All metal parts receive one shop coat of paint before shipment.

All finishing coats should be applied by the painting contractor.

Advantages

Maximum Light and Vision—Sash are continuous from sill to head with no obstruction from horizontal meeting rails.

Ventilation—Ideal changing of air without drafts. The sash control forms flue that draws out all impure air, which is automatically replaced with fresh air. A pleasant quality of ventilation is obtained by bowing sash open to extent of catch hook attached to center upright. This gives fresh air intake at bottom, exhaust at top, with no opening at sides.

**National Board of Fire Underwriters Building,
New York, N. Y.**

CLINTON & RUSSELL, WELLS, HOLTON & GEORGE, Architects
JAMES STEWART & Co., Builders

Weather Protection—The airtight and dustproof qualities of the windows have been established under laboratory test of 140-mile wind velocity.

Noiseproof—Thick felt contact cushions practically shut out street noises when window is closed.

Safety—All parts of the sash are accessible from the inside. The expense and danger of outside window cleaning and painting are eliminated.

Simplicity—No track mechanism for the accumulation of dirt and water. No weight boxes to invite drafts and annoyance from noise; no chains, weights or pulleys to get out of order; no rattling of parts when open or closed.

Contact—No metal to metal weathering contact. The contact in all cases is metal to felt.

Service—Continuous and lasting, with no danger of sagging, warping, racking, or wearing off paint.

Operation—Smooth, easy, noiseless; without physical effort the sash may be

opened to any desired angle. Releasing catch handle, pushing sash partly open and a slight pull at the edges of sash towards center opens window full extent. Pushing edges of sash away from center brings handle within easy reach for closing and locking. The handle is a most convenient latch attachment and is intended for this use only. Where windows can not be reached from the floor, our standard operator may be applied, locking the window in any position.

Strength—All parts are sturdy and substantial; the greatest care is taken in the construction and assembling to insure rigidity and permanence.

Curtains, etc.—Curtains, shades, Venetian blinds, and inside screens may be applied as for ordinary sash.

Economy—Minimum cleaning and maintenance costs; assurance of maximum results from heating arrangements; and fuel saving due to dependably tight openings are prominent features.

Hardware—Furnished by us with the window.

Products

STEVENS UNIT CASEMENT WINDOWS and SCREENS.
CASEMENT WINDOW HARDWARE.
Patented in United States of America and Canada.

Unit Casement Windows

Advantages—A completely assembled product including frames, sash, glass, screens, weatherstrips. Suitable for all kinds of construction, and architect's details. Guaranteed to be weathertight. Complete control of ventilation without direct drafts. Our ventilated transom window is especially suited for schoolhouses and hospitals. Transoms operated without disturbing screens or shades, or may be fixed.

Ease with which windows can be cleaned on the outside from within—thus eliminating danger in cleaning.
Simplicity of construction.

May be installed in old frames without disturbing interior or exterior finish.

Materials—Frames—Either for brick or wood construction from good seasoned white pine made to our standard or architect's details.

Sash— $1\frac{3}{4}$ in. thick from best white pine.

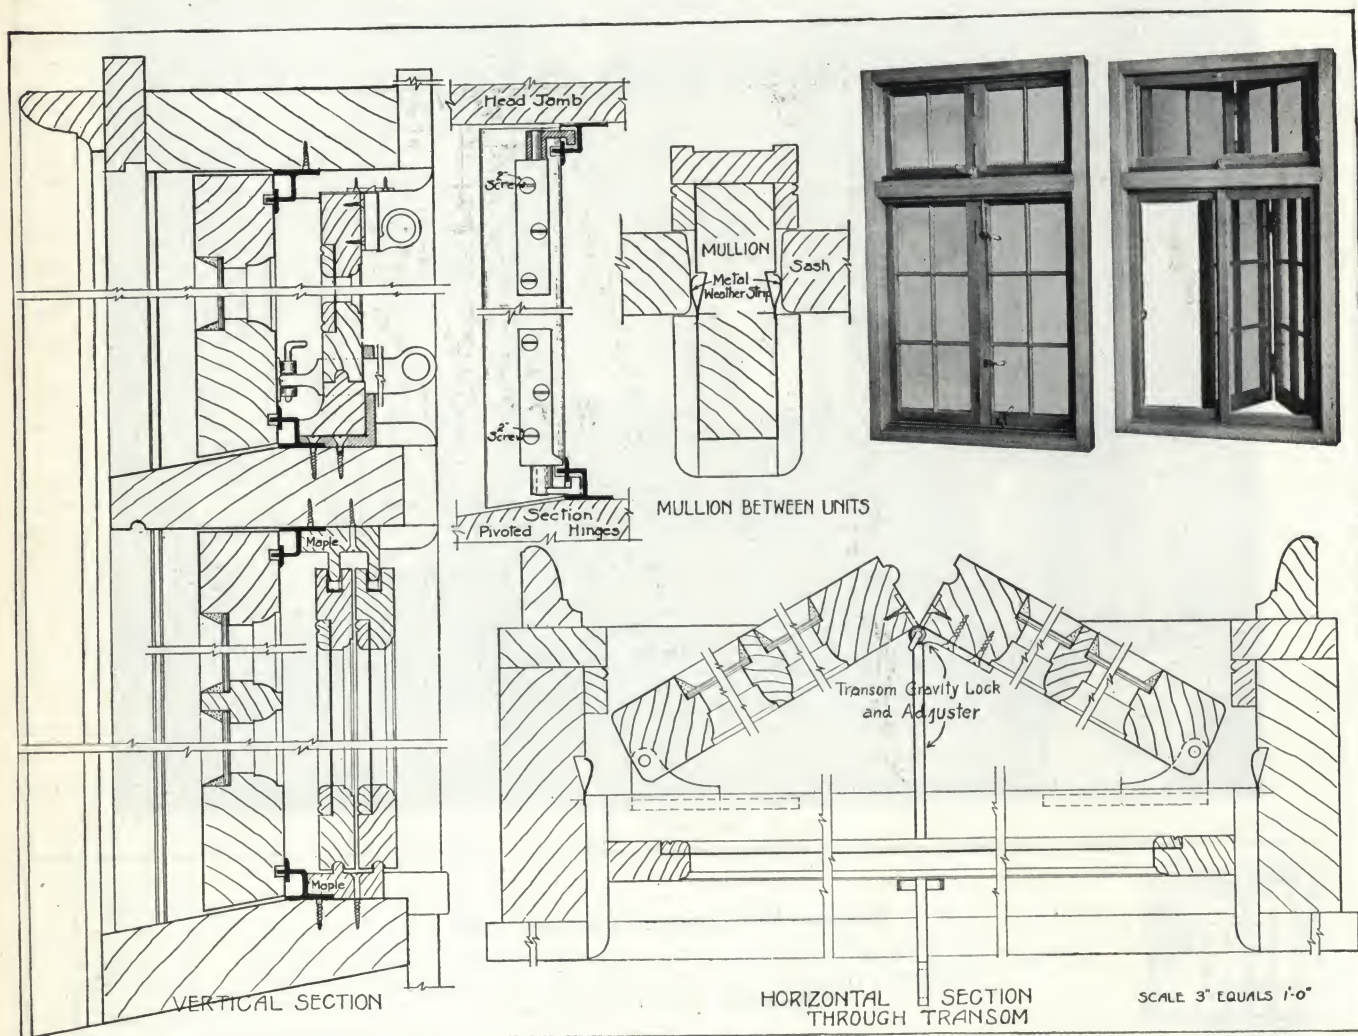

Glass—Selected quality in the varying thicknesses. Glazed with the best glazing compound.

Screens—Made from best of rift sawed white pine, wired with 16-mesh dark copper screen cloth.

Hardware—All solid brass to our special detail, and completely fitted to sash. Special finishes of hardware may be furnished.

Installation—Windows are delivered at the building assembled, and carpenter has only to set units in openings designated on the plans. This completes the job in-so-far as the operation of sash and screens is concerned. We do not furnish interior trim. For frame construction make rough openings 5 in. wider and higher than size of sash to be used.

Operation of Sash—A slight outward push in the center of each pair of sash will make the units fold together; they can then be slid to either side, or they may be placed in any position so as to give as little ventilation as desired. The windows are held firmly in any position, and irrespective of the wind velocity will not rattle. For single sash or groups of three,

Details of Stevens Unit Casement Windows with Transom

the odd single sash opens similar to the units, except that one of the pivoted corner hinges is replaced by an arm, one end of which is secured to sash, other being fastened to jamb, allowing sash to remain rigid in outswung position.

Note: Sashes may be glazed with "Vitaglass," the health-giving window glass, which transmits the curative ultra-violet rays of daylight.

Further information and full sized details for either brick or wood construction furnished upon request.

Hardware for Stevens Unit Casement Windows

The extruded brass track (Fig. 1) is screwed to stool and head jamb the entire width of each opening; the horizontal projecting tongue of track acts as a weatherstrip, fitting into a groove in the sash. The pivoted hinges (Fig. 2) are of cast brass; each hinge slides in extruded track from which it is impossible to become disengaged. Commercial spring bronze weatherstrips are furnished full length for each pair of jambs. Butts are 3x2 in. and are solid wrought brass; two or more

being required for each pair of sash, depending on height of sash. The polished cast brass handle and lock (Fig. 3) is used as a lock, a slight turn securely fastening the sash. Polished cast brass top lock for use on high sash (Fig. 4); one lock required for each pair of sash. Transom gravity lock and adjuster for operating transom only (Fig. 5). Loose pin butt (Fig. 6). Handle to open and close the window (Fig. 7).

J. S. THORN COMPANY

Manufacturers of Solid Steel Casement Windows

20th and Allegheny Avenues, PHILADELPHIA, PA.

NEW YORK, N. Y., 21 East 40th Street

BOSTON, MASS.

Products

THORN STANDARD RESIDENCE and MANOR TYPE CASEMENTS for residences, apartments, dormitories, etc.

THORN MEDIUM and HEAVY TYPE CASEMENTS—Side Hung and Projected.

For other Sash Products, see pages A1080-1081.

Thorn Standard Residence Type Casements

Produced in standard sizes, made of specially rolled solid steel casement sections of substantial weight, and designed to produce a most rigid construction. At all corners the sections are mitered, electrically butt-welded and ground to a smooth finish. Steel muntins have a $\frac{5}{8}$ -in. face and all intersections are flush and electrically welded. All casements are accurately made, carefully fitted and when properly installed in the building are weathertight under all conditions. Casements are equipped with Thorn solid bronze straight handles and strikers, and Thorn cleaning hinges of solid bronze.

Thorn Cleaning Hinge

—A new type sliding hinge of solid bronze for Thorn solid steel casements, which, when closed has the appearance of an ordinary butt hinge and,

when open, permits cleaning of the glass from the inside. Not only is the unsightly extension or offset hinge eliminated, but also the sill adjusters, as the Thorn sliding hinge, with friction adjustment, holds the casement securely, top and bottom, in any position.

Thorn Casements Readily Cleaned from Within

Advantages—Thorn metal casements provide a distinctive quality and an architectural appearance which can not be obtained by the use of wood windows. They have all the advantages of double hung windows and, in addition, they provide 100% ventilation. They control ventilation by conducting breezes into the building and to a certain extent will exclude rain while the windows are open. They are economical, costing no more than a good quality wood casement and are more reasonable in price than double hung windows. They need not be weatherstripped because of their watertight construction. They can not warp, shrink, or swell as do wood windows.

Thorn Cleaning Hinge, Showing Slide and Friction Adjusting Screw

Standard Specifications

All openings shall be fitted with Thorn standard residence casements as manufactured by the J. S. THORN COMPANY, Philadelphia, Pa. All corners shall be mitered, electrically welded and ground to a smooth finish. Muntin bars shall have a $\frac{1}{8}$ -in. face, and all intersections of muntins shall be flush and electrically welded. Fasteners shall be Thorn's standard straight type No. 201 of solid bronze, light statuary finish. All casements shall be equipped with the Thorn cleaning hinges of solid bronze, permitting cleaning from within and eliminating all exposed sill adjusters or peg stays. Before leaving the factory, all windows shall be given 2 coats of Thorn standard gray elastic enamel either air dried or oven baked as directed by the architect.

Standard Sizes

In order to keep the price of Thorn residence type casements as low as possible they are produced in large quantities of standard sizes. Below are shown the standard units carried in stock and their over-all dimensions. Openings of two or more units, both in height and width, can be obtained by the use of steel mullions. For each steel mullion $\frac{1}{8}$ in. must be added to over-all dimensions of the units.

Thorn Manor Casements

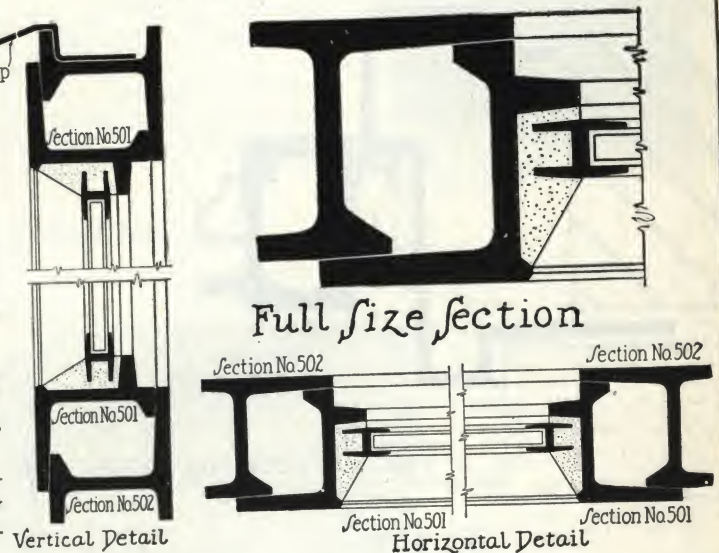

A standardized casement of the finest quality combining the very best of materials and workmanship.

The design of the sections incorporates refinements of the most minute nature to gratify architectural desire for a sturdy, well made casement, particularly adapted to leaded glass with neat, narrow sight lines and short putty levels.

The famous Thorn Hinge, strong, pleasing to the eye and unequalled in performance, is standard equipment.

The "Manor" is an accomplishment in steel window craft befitting the finest architecture.

will at all times be glad to co-operate with architects, owners and builders in the proper preparation of details and will forward on request our booklet covering usual installation conditions for Thorn standard units.

Thorn Medium and Heavy Type Metal Casements

For use in more elaborate residences, churches, banks, office buildings, etc. Constructed of heavy 2-point specially rolled steel casement section. Constructed with the same care and accuracy as Thorn light casements. Glazing may be provided for by the use of putty only or glass may be held in place with drawn steel glazing beads which are accurately mitered at the corners and held in place with brass oval head screws. Solid bronze hardware is used throughout.

Where desired, Thorn medium and heavy type metal casements may be provided with a metal subframe which is built in and the casements placed after openings are prepared.

Made to open outward or inward. These larger sections lend themselves admirably to the construction of French casements or doors with bronze thresholds, steel kick panels and suitable locks and other hardware.

Architectural Service

In designing buildings in which Thorn metal casements are to be installed, it is always well to detail the openings to receive the windows after masonry work is completed. We

ALLISON STEEL PRODUCTS CO.

Steel Windows, Doors and Partitions

CHESTER, PA.

Pivoted Factory Steel Sash

Allison sash are made of heavy cove shaped steel sections joined together at the intersections by neat flush miter joints electrically welded, combining strength and neatness.

The ventilators have double contact weathering on all sides, and are hung on substantial steel pivots.

The ventilator hardware furnished with the windows consists of push bar, spring catch and chain or cam latch and chain.

We recommend push bar for all vents within reach from floor, and spring catch and chain for all vents out of reach.

The sash can be set in any type of masonry, steel or wood, and we furnish complete hardware.

Standard sash are designed to receive 12x18 and 14x20-in. glass and the opening dimensions for single units are as follows:

Lights wide	12-in. glass		14-in. glass		Lights high	18-in. glass		20-in. glass	
	ft.	in.	ft.	in.		ft.	in.	ft.	in.
1	1	11 1/4	1	3 1/4	1	1	7 1/4	1	9 1/4
2	2	15 1/8	2	5 5/8	2	3	15 1/8	3	5 5/8
3	3	22 1/4	3	8 3/8	3	4	22 1/4	4	8 3/8
4	4	29 1/8	4	10 3/8	4	6	29 1/8	6	10 3/8
5	5	35 1/8	5	12 3/8	5	7	35 1/8	7	12 3/8
6	6	41 1/8	6	14 3/8	6	8	41 1/8	8	14 3/8

Combine any 12-in. width with 18-in. heights, and 14-in. width with 20-in. heights.

Two or more units may be combined in an opening, and the opening size determined by adding the sizes of the units together plus 2 in. for each mullion.

Projected Ventilator Windows

This type of window is for use in the better types of buildings, such as offices, schools, hospitals and hotels.

The vents can be arranged to open in or out, and project beyond the sash only on the side on which they open.

They are furnished with appropriate fittings in malleable iron or brass.

This window is made in various designs and the division of glass can be so arranged to present pleasing architectural effects.

Steel Tube Doors

Allison steel tube doors are made of rectangular steel tube stiles with sash and plate inserts, as desired.

They are for use in factories, warehouses and all types of industrial buildings where sturdy construction is necessary.

They are made hinged or sliding, are furnished with or without channel frames.

Suitable hardware, including latch or cylinder lock, is furnished with the door.

Continuous Steel Sash

This type of sash is used principally in monitor and sawtooth construction. It is very advantageous for natural lighting in wide buildings, and by means of its ventilating possibilities it is very useful in carrying off gases, impure air or smoke.

It can be kept open in storms which do not reach the driving stage, due to the awning-like effect of

sash together with the overlapping storm panels at the ends. This sash is made of heavy structural members solidly riveted together. Sill section is so constructed that condensation is carried off without use of metal gutters.

Made stationary and ventilated. Ventilating type is operated by Allison operator.

Complete catalogue will be mailed on request.

Bayley-Springfield Windows

Bayley-Springfield Windows are backed by 46 years of continuous manufacturing experience and 18 years of solid bar window sash manufacturing experience. Made in a variety of kinds for a variety of purposes. Tell us what you want and permit us to submit the necessary detail matter. The following is only suggestive.

Bayley-Springfield Center Pivoted Windows

Standard Sizes—50 layouts in 14x20 glass size and 50 layouts in 12x18 glass size shown on following page. These units are produced in large quantities and when used singly or in combined unit openings, meet practically all building conditions where center pivoted windows are applicable. Designers should confine requirements to these sizes to get the benefit of low prices and quick deliveries.

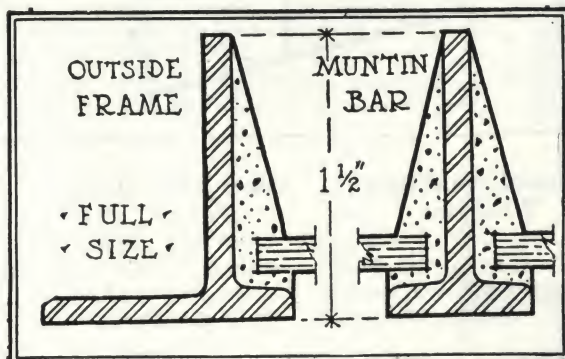

Frame and Muntin Bars—1½ in. deep provide strength and rigidity.

Ventilators—Center pivoted (CP). Have double weathering contact 1⅝ in. deep at sides and 1¾ in. deep at top and bottom. Exceptionally strong and deep at top and bottom. Exceptionally strong and tight.

H CAM

Two used with push bars.
Alternate for F lock bar at additional cost

PRINCIPAL BARS
Full size sections

INTERSECTION

Simple, strong, pleasing appearance. Bars not bent or manipulated in assembling, therefore, steel can be and is of strong character. Surfaces get-at-able for easy and complete repainting

C CHAIN CATCH

Made of steel, sherardized.
Used when ventilators are high up

VENTILATOR TPO
F lock bar hardware—the most frequently used kind

VENTILATOR CP
Chain catch hardware—for use above reaching distance

VERTICALLY PIVOTED (VP)
VENTILATOR
With usually furnished hardware

PROJECTED OUT (PO)
VENTILATOR

The kind here shown has many merits of other kinds and some individual ones. Users of steel windows may well give it careful consideration

BOTTOM PIVOTED INSWINGING
(BP) VENTILATOR
With usually furnished hardware

BAYLEY-SPRINGFIELD SIDE WALL WINDOWS

Paint—One shop coat of Bayley-Springfield stand-
ard red.

In Stock for Immediate Shipment—20 sizes in
14x20 glass and 19 sizes in 12x18 glass carried in stock.
These are a selection of most popular standard units and
are shown in heavy outline on drawings number 166 and
167 below. They are constructed the same as made-to-
order windows and are carried in warehouse and by
dealers.

Bayley-Springfield Utility Windows—In stock.

*Made in one size 3 ft. 4 in. wide by 3 ft. 7 $\frac{5}{8}$ in.
high. Standard Bayley-Springfield construction sections
1 $\frac{1}{2}$ in. and 1 $\frac{5}{8}$ in. deep, 3 lights wide and 2 lights high—
top 3 lights ventilated.*

Paint—Bayley-Springfield Utility Window gray.
Ideally adapted for small structures such as garages and
similar buildings.

F Horizontal Mullions—Usually not furnished
by this company. Made of structural materials and per-
mit using one unit above another for power houses, etc.

BAYLEY-SPRINGFIELD STEEL WINDOWS

Anchorage—Secured in masonry openings by embedding the outside frame member in cement fill, or by the use of Economy inserts. Windows may be clamped to structural steel by use of clips and bolts which are furnished when specified. Type of head, sill and jamb must be stated.

When Writing for Quotations—Avoid delay by giving complete information as follows:

Type of units; number of units; number and kind of mullions, if any; kind of hardware (lock bar, push bar and 2 cams, chain catch). If chain catch hardware is desired give distance from sill of window to floor. If to be installed in structural steel (anchors consequently required), state where anchors are needed. State when shipment is required.

Quotations—Cover window units complete with or without ventilators as specified. M mullions as required, with

necessary clips and bolts, F lock bars (1 to each ventilator), 4K glazing springs (4 to each light), and (only when specified) 3A or 66A clips spaced about 2-ft. centers for attachment to structural steel.

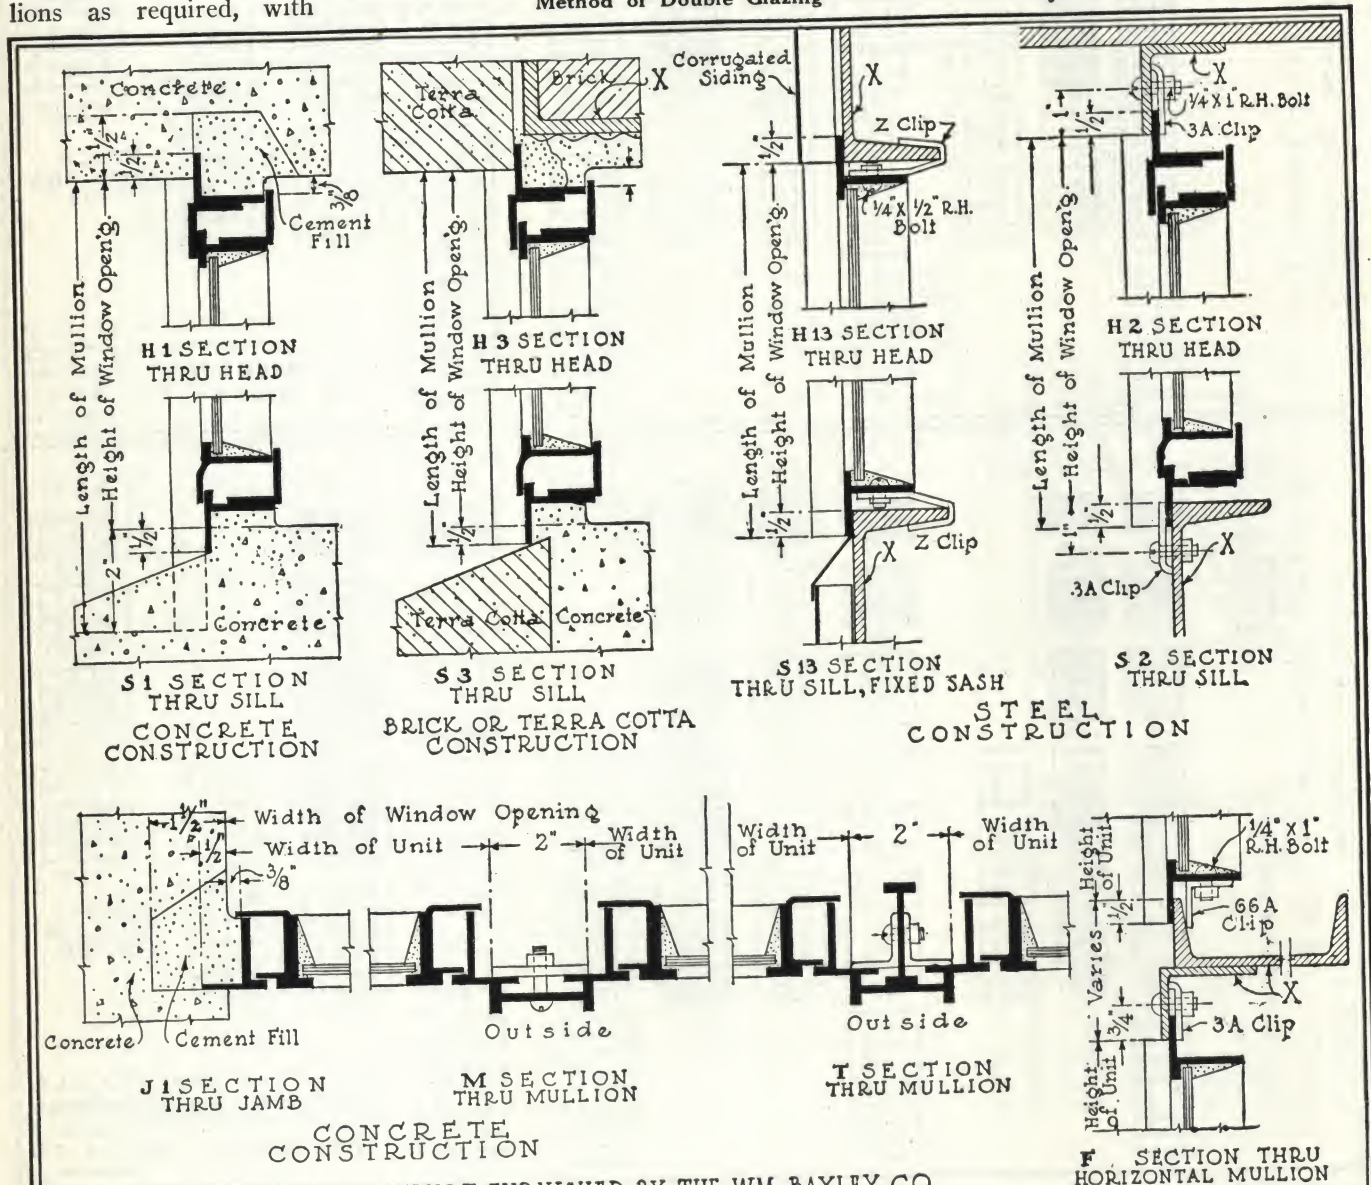

Quotations do not cover (unless specifically stated) structural materials and parts not established and standardized as parts of steel windows and recognized as such in the practices of the trade, glass, putty, erections, glazing or other labor, etc.

Double Glazing—As a means of promoting comfortable living conditions in summer and conserving heat in winter, is effectively provided for in Bayley-Springfield.

The excessive depth of the bars admits of sufficient dead air space between two panes of glass and entirely eliminates objectionable features.

Method of Double Glazing

NOTE:—MEMBERS MARKED "X" NOT FURNISHED BY THE WM. BAYLEY CO.

THE WILLIAM BAYLEY CO.
SPRINGFIELD, OHIO, U.S.A.

BAYLEY-SPRINGFIELD SIDE WALL WINDOWS

SCALE 3"=1'-0" DRAWING NO. 2

Bayley-Springfield Projected Ventilator Windows

Ventilators balance on pivoted arms and simultaneously move down and out, or up and in, sufficient friction being provided to hold them in any desired position. Sliding mechanism parts are of brass.

Bayley - Springfield CC Windows with Projected Ventilators—Are a highly standardized manufactured product, the merits of which have produced a demand sufficient to permit quantity production and, with it, high quality and low cost.

For standard layouts see Drawing 170 below.

For sizes use dimensions

of corresponding units on second preceding page.

Bayley-Springfield BB Windows—Are an extremely high grade product at a surprisingly moderate cost. They are of layouts shown in drawings 119 and 120 and incorporate such structural and quality features as welding of corners of both ventilators and ventilator openings, glazing stops, solid bronze hardware and preparation for attachment of shade brackets.

These windows lend themselves readily to screening and may be prepared for steel screens at but slight additional cost.

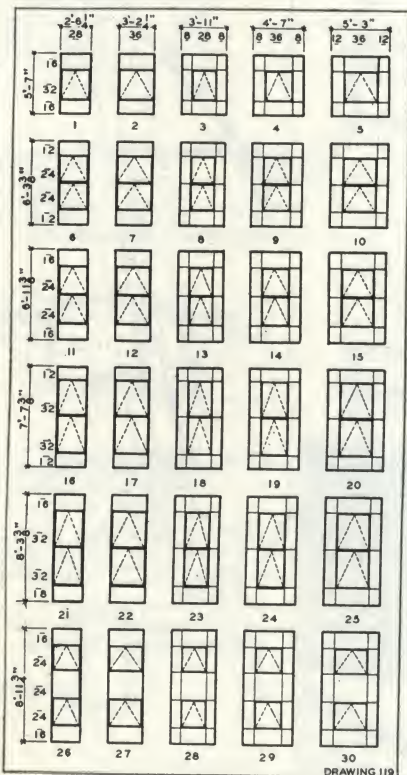

Bayley-Springfield Basement Windows—Ventilated 100%

Immediate shipment. Masonry openings and glass sizes, see drawing No. 135. Have a heavy stiff frame. Have a strong ventilator with 1 1/2 in. deep muntins. Easily removable and replaceable. For use in wood, brick, concrete or tile. Inexpensive, cost no more than wood

CC WINDOW LAYOUTS

BB UNIT 3'10" x 6'2 3/8"

BB WINDOW LAYOUTS AND SIZES

BAYLEY-SPRINGFIELD PROJECTED WINDOWS

Continuous Windows

Continuous windows here pictured and described for use in roof construction, are suited to use in side walls and are frequently so used. They are particularly desirable in positions where utility or convenience may be served by mechanically opening a large glass area. Engineers thoroughly versed in the details of the product itself and its use, are at your service either from Springfield or from one of our branch offices. You incur no obligation in availing yourself of this service.

They differ from other Bayley-Springfield in the material of which made and in the details of construction. Their glass is inserted from the outside.

Their top and bottom horizontals are $2 \times 2 \times \frac{3}{16}$ -in. angles; vertically $1\frac{1}{4} \times 1\frac{1}{4} \times \frac{3}{16}$ -in. tees.

They have an extra horizontal $1\frac{1}{4} \times 1\frac{1}{4} \times \frac{3}{16}$ -in. angle for attachment of mechanical operators.

They are made in four standard lengths with provision for field splicing to meet practically any requirement.

They are made in four heights which may be combined one above another. The 3-ft. height should be

used for the hinged panels. Hinges, heavy steel butts with bronze pins properly spaced and securely riveted to top horizontals, are positioned not to interfere with flashing materials. See catalogue for more details.

Weather-tightness is provided by lapping, shingle fashion, the tops under, the bottoms over, throughout their entire length, and by the use of underlying storm panels at the ends.

Bayley-Springfield for Monitor and Sawtooth Roofs

Sidewall windows thus used (see section at left) afford opportunity for simplicity and economy. They are means by which all windows of a building may be alike, at least, in glass light sizes and ventilators. They must be used in the vertical position.

Continuous windows as shown below and in section at right are better suited to many of the larger installations.

Architects' Specifications—Use wording which appears on the following page with proper insertion of words "Bayley-Springfield continuous windows," or "Bayley-Springfield sidewall windows for monitors."

Bayley-Springfield Residence Casements

Made in England. They open out and are glazed from the outside. One dip coat of standard gray paint is applied before shipment. Wide frames are used around all units. Measure one and three-sixteenths inches and provide additional space inside for plaster or other interior finish and also sufficient engagement into walls for weatherproofing. Leaded glass panels may be used. Mullion and transom bar dimensions must be

added to casement widths and heights given on plate 174. For vertical mullions add one inch and for horizontal transom bars add five-eighths inch. Hinges of standard type set close to the window, of heavy steel with heavy bronze pins, are furnished on all casements except on windows 2 and 6 lights wide, where hinges of extension or cleaning type are used. Handle of malleable iron is standard but may be of bronze at additional cost. It has bronze working parts, provides two slightly open positions and a tight contact when closed.

Peg and stay of rolled steel is standard but may have bronze arm and peg at additional cost. Finish of hardware, if of iron or steel is like the casement, and if of bronze is smooth nut brown. Prices include hardware, necessary fixing anchors, horizontal and vertical mullions with bolts, if any are required, 2 glazing springs per light and mastic for weatherproofing. Copper drip is furnished over casements that extend to the head of openings. For complete details send for catalogue R. C. 27.

PLATE
NO. 174

BAYLEY-SPRINGFIELD RESIDENCE CASEMENTS

Bayley-Springfield Steel Doors

Primarily for use in industrial buildings. Parts heavy enough and details strong enough to insure continued, satisfactory working under rough and abusive conditions of service. Outer members are thick walled steel tubing. Filling is made of steel window shapes. Usually glazed in the upper portion and provided with a steel plate in the lower. Some are made with steel plates in both portions. Tube corners are reinforced (see BEB below) for strength and along the miter lines to hold the metal heated to fluid condition during the welding process. Plate is flanged on four edges and stretched during riveting so that it is free from buckles and serves as a truss.

Frames for hinged doors are usually channels and contemplate the sills being of concrete. Send sketches of openings for recommendations. Frames for sliding doors usually not required.

Architects' Door Specifications

The standard of quality adopted for the steel doors is that established by THE WILLIAM BAYLEY CO., Springfield, Ohio, in the manufacture of Bayley-Springfield steel doors, and bidders are required to base their proposals upon the use of this Bayley product.

"Any bidder may submit an alternate on another make of steel doors, but in doing so must give the name and address of the manufacturer, together with evidence that the product is equal to the adopted standard in strength, permanency, design, finish and workmanship."

BAYLEY-SPRINGFIELD STEEL DOORS

BLISS STEEL PRODUCTS CORPORATION

Manufacturers of Solid Steel Windows

EAST SYRACUSE, N. Y.

Bliss Solid Steel Windows (Patented)

Bliss steel windows are made of solid sections rolled from low carbon steel.

Joints are interlocking and designed for maximum strength. Corners of outside sections are acetylene-welded to develop full strength of the section.

Hinges have a double bearing on the pins so as to insure minimum wear.

Ventilators are center pivoted and operated with cam and stay bar or spring catch and chain. Always specify which is required, otherwise ventilators coming at the bottom or within one light of the bottom will be provided with cam and stay bar operator, and all others with spring catch and chain.

Ventilators have double contact weathering—one

contact of metal to wood and one of metal to metal. This metal to wood contact is an exclusive Bliss feature. The wood is selected clear grained cypress, which is not subject to mechanical wear and will last as long as the steel. It makes a tighter contact than is possible between two pieces of steel. Ventilators are wedged in position after fitting and can not get out of alignment with the sash.

Glass is held in place by glazing springs, four springs being furnished for each light.

Flat bar mullions are provided where necessary, if sash is not more than 3 lights high. T-bar mullions are provided for sash 4 lights high or more.

Where weathertightness is important, specify Bliss steel windows—they will reduce fuel bills.

Solid Steel Projected Windows, Architectural Standards

Suitable for schools, banks, offices and public buildings where controlled ventilation, assured weather protection and maximum light are of prime importance. Furnished with ventilators: (1) Both slide down from the top and open out at the bottom (Fig. 2). (2) Both slide up from the bottom and

open in at the top (3) upper ventilator opens out, lower ventilator opens in (Fig. 3).

Direct and indirect ventilation and weather protection are thus secured at all times. Ventilators can be tilted for easy cleaning from the inside. See Fig. 4 for standard sizes.

Fig. 4. Standard Sizes of Boca Architectural Projected Windows

Widths and heights given above are wall opening dimensions. Diagonal lines converging at the top indicate ventilators opening outward; diagonal lines converging at the bottom indicate ventilators opening inward. When vertical mullions are used, allow 2 in. for width of tubular mullion and 3 in. for channel mullion (Fig. 6).

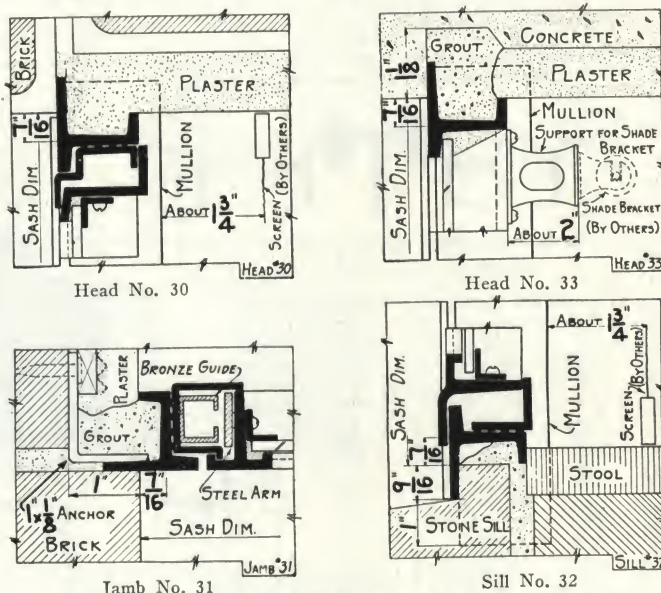

Fig. 5. Standard Installation Details of Architectural Projected Windows

Head No. 30—Standard for brick construction with steel lintel where plaster ceilings occur. Position of window screen indicated.

Head No. 33—Standard for concrete construction with plaster ceiling. Support for shade bracket and location of shade indicated.

Jamb No. 31—Standard for brick openings with interior plastered wall. Section indicates position of bronze guide or runway for open out ventilators. Similar for concrete construction.

Sill No. 32—Standard for stone sill. Sills must be cut to receive vertical mullions where they occur. Sills of concrete, terra cotta or brick are similar in detail. Position of screen indicated.

Fig. 2. Boca Architectural Projected Window with Open Out Ventilators

Fig. 1. Boca Bronze Guide or Runway

A new feature found only in Boca Architectural and Commercial Projected Windows. This bronze runway contains a steel friction shoe and spring which give free and uniform operation of the ventilator at all times, and hold it open at any desired angle. This device requires no paint, therefore never sticks, binds nor rusts; always functions with perfect ease and requires no adjustment—all exclusive Boca features.

(1) **Open seam rectangular bronze runway.** Contains the steel friction shoe and spring (2).

(2) **Friction spring.** Specially tempered. Designed as a part of the steel shoe. Exerts even pressure against inside of bronze runway (1) and assures uniform operation of ventilator.

(3) **Steel friction shoe.** Slides within the bronze runway (1) with the action of the ventilator and holds it open at any angle by friction. The ventilator pivots on steel pins at either side, riveted in position and extending into the friction shoes.

Fig. 3. Boca Architectural Window with Upper Open Out and Lower Open In Ventilators

Equipped with the Boca bronze ventilator runway shown in Fig. 1. No. 115 channel frame member is used all around the window.

Standard hardware is of *bronze*, as follows: For upper ventilators, pole operated—pole ring and spring catch. For lower ventilators within reach—cam and strike for open in ventilators or cam for open out ventilators.

Shade bracket supports (Figs. 5 and 6) are furnished if specified.

Glazing angles furnished when specified.

Furnished with Underwriters' label, if specified, as explained below.

Fig. 6. Boca Vertical Mullions for Architectural Projected Windows

These mullions produce a vertical paneled effect and attractive interior finish. Their heavy design meets the requirements of rigidity, economy and durability. They have a double contact with the outstanding portions of window frame members and are attached to same by a single line of bolts with bronze cap nuts, thus reducing installation cost to a minimum.

Note shade bracket supports (furnished only when specified) which are tap screwed in position before or after window is set. Slotted holes are provided for shade brackets.

Steel Projected Windows, Commercial Standards

Suitable for schools, also office, commercial and light manufacturing buildings where ventilation and light are important factors. Standard glass sizes: 14x20 and 12x18 in.

The top and bottom ventilators may be either open out or open in as specified.

These windows differ from the Boca Architectural Projected Windows in that they are furnished with iron hardware and have a tee frame instead of a channel frame.

These windows are also equipped with the Boca bronze ventilator runways shown in Fig. 1.

Standard iron hardware: cam for open out ventilators within reach; pole ring and spring catch for open out ventilators, pole operated. Upper and lower open in ventilators have similar iron hardware. Bronze hardware and glazing angles same as for Architectural windows will be furnished when specified.

Shade bracket supports (Fig. 8) are furnished if specified.

Furnished with Underwriters' label, if specified, as explained below.

Section shows bronze runway for open out ventilator.

Jamb No. 22—Standard for brick openings with interior plaster.

Section shows bronze runway for open out ventilator.

Jamb No. 26—Standard for concrete walls with interior plaster.

Section shows bronze runway for open out ventilator.

Sill No. 23—Standard for stone sill. Sills of concrete or brick are similar in detail. Position of screen indicated.

Fig. 9. Boca Commercial Projected Window with Open Out Ventilators

Vertical Tubular Mullion

The vertical mullion is used where mullion width is 2 in. Consists of an exterior 2-in. steel flat and an interior 2 1/2 x 1 1/2 in. tubular member. Interchangeable with Boca standard angle or tee mullions, but costs slightly more.

The horizontal tubular mullion shown at the right is of the same construction as the vertical tubular mullion, and is used in conjunction therewith. Horizontal mullions furnished only when specified.

Fig. 10. Boca Mullions for Commercial Projected Windows

These mullions have the same advantages as the mullions shown in Fig. 6. Note shade bracket support (furnished only when specified) which consists of an angle bracket and a channel extension.

Projected Windows Furnished with Underwriters' Label When Specified

Underwriters' requirements are: All ventilators must open out, not more than two ventilators may be used in one window, mullions must be steel tees bolted to the windows and secured to lintel and sill, all hardware must be of iron, exposed glass area must not exceed 350 sq. in. for any single light, glazing angles must hold glass in position.

Boca bronze runways always furnished with Underwriters' labeled windows.

Boca Solid Steel Pivoted Windows

Made of solid rolled steel members $1\frac{1}{4}$ in. deep. The patented Boca lock-joint produces an exceptionally rigid sash that will not get out of square; the metal is not distorted and the exterior surface is smooth and has a neat appearance.

Ventilators are horizontally pivoted 2 in. above their center. Patented continuous 3-point weathering at the sides and 2-point weathering at top and bottom of the ventilator are special features that give 100% weatherproof construction.

The vertical mullion consists of a $2\frac{3}{4}\times 1\frac{1}{2}$ -in. tee. This tee is occasionally reversed with the stem outside. Another vertical mullion consisting of 2-in. angle and a flat is frequently substituted for the tee mullion to give liberal installation adjustment. Structural horizontal mullions for supporting window units placed one above the other (detail 26) are only supplied when specified.

All details of the head, jams and sill sections of the Commercial Projected Windows, described on preceding page, apply to Boca Pivoted Windows.

Hardware consists of either a notched push bar with attachments, or a spring catch and chain. Four spring steel wire glazing clips are furnished for each light.

Boca Underwriters' Labeled Pivoted Windows—Same as Boca solid steel windows except that glazing angles are furnished to hold glass in position. Inspected and labeled by the Underwriters.

Boca Mechanical Sash Operators

Rack and Pinion Type—For operating continuous windows in any length, height of opening, or slope.

Rocker Shaft Type—For controlling ventilators in side-wall sash in runs or batteries.

Boca Steel Partitions

Constructed of regular Boca steel window units joined by mullions, with sheet steel panels in the lower sections. Built to meet the requirements of any building condition.

Boca Continuous Windows

Top hung and fixed type, for monitor, sawtooth, A-frame, foundry and other types of roof, also sidewalls. May be placed either vertically or sloping. Operated by mechanical operators, arms of which are attached to bottom rail of ventilated portion.

Made of rolled steel members with all joints acetylene welded. Standard panels are 20 ft. long and 3, 4 and 5 ft. high. Special lengths of 10 to 18 ft. can be supplied. Clips are supplied for holding glass in place.

A storm panel forming part of a fixed panel directly back of the end light of the top hung panel gives weathering protection against slanting rains.

Types of Roofs Where Boca Continuous Windows Are Adaptable

Weathering Features of Boca Continuous Windows

(1) Top rail and hinge. These weather back of girt angle at head of opening. (2) End of panel. Weathering flat used only at end of run. (3) Bottom rail of sash. Closes against girt angle at sill forming weathering. (4) Interior muntin bar. Welded to top and bottom rails.

Boca All-Steel Garage Door Unit

Made and shipped complete, including 4-in. steel channel frame on all four sides, foot bolt, chain bolt, automatic door holders, door latch and pull handles. Each unit comes in four pieces—2 doors with 4-in. jamb channel frame attached, one head channel and one sill channel. Fireproof; do not warp, sag nor bind, and cost approximately the same as old-fashioned wood doors. In two sizes to fit wall openings 8 ft. wide x 8 ft. high and 8 ft. wide x 7 ft. 6 in. high.

Boca Side Entrance Steel Garage Door—This single door is of similar construction, with 3-in. steel channel frame on all four sides to fit wall opening 2 ft. 8 in. wide x 6 ft. 8 in. high. Complete with lock and other hardware.

Garage Door Unit

Single Swing-ing Door

Double Sliding Door

Boca Industrial Steel Doors

For factories, public garages, etc., or wherever steel doors with glass panels are required.

Hinged doors are complete with standard handle, knob and bronze lock; sliding doors with standard bow handle, foot and chain bolt, hasp and staple and overhead track and hangers.

The standard sizes of single swinging doors given are inside dimensions of steel channel door frames. For single sliding and double sliding doors, the standard sizes given are 3 in. wider and $1\frac{1}{2}$ in. higher than the actual door opening to provide for overlap at head and jambs.

St. Louis University High School Building

Peter Goulet, Contractor

Mesker's New Sash (Cruciform Type)—Extra Heavy

Not only has sufficient weight been added to this type of sash to make it equal to any on the market but the following principles underlying its construction insure a quality product throughout. Made from solid rolled steel sections of $\frac{1}{8}$ -in. stock, 1 in. by $1\frac{1}{2}$, the vertical or horizontal bars being solid. *No cut outs* of any kind to impair the rigidity of the sash as a whole. All joints and intersections are interlocked and thoroughly *arc welded* giving it excessive strength and rigidity. Handwork practically eliminated in the assembly resulting in uniform perfect fitting. Can be furnished with or without Underwriters Label.

Welding

The sash are assembled in a jig and electrically *arc welded* with Lincoln welders. This process not only gives a perfect fit through the accuracy of the jig which makes all corners true and square, but also causes the sash to become practically one continuous section without any joints. Thus a perfect fit with maximum rigidity and strength is assured.

Outside Glazing

This type of sash permits outside or inside glazing or both. With outside glazing the metal is protected from weather contact by the putty, as merely the thickness of the bars ($\frac{1}{4}$ in.) would be exposed thereby minimizing deterioration through rust and corrosion. Exterior painting is practically dispensed with.

Weathering (Single Contact)

On all types of Mesker Pivoted Windows flat surface contact is used unless otherwise specified. A continuous flat weatherproof contact of $\frac{3}{8}$ -in. around all sides of Ventilator is given except at bottom of Ventilator where two point contact is employed.

Double Contact

This type of weathering furnished on all Extending or Projected types of windows as well as Casements. Can be furnished on Pivoted Types if so specified.

Bronze Weather Stripping

Our patented spring bronze weather strip is a perfect weathering appliance, giving assurance of absolute tightness,

preventing rattle and is wind and dust proof. Furnished only when specified.

Pivots

Standard Pivot—This pivot is simple in construction. It can not rust tight, and breaking off is eliminated by the fact

Malleable
Iron
PivotStandard
Hingeless
Pivot

that the ears, upon which the ventilator rides, are welded to the frame bar of the ventilator. The Ventilator may be removed at will for cleaning or glazing.

Malleable Iron Pivot—The pivot as shown in the sketch is very similar to the above described pivot in its action. The bearing surface is much larger giving smoother operation. It is so constructed as to make the ventilator and the frame practically as solid as one piece and yet when in the proper position the ventilator may be easily removed. This pivot is cast in two pieces and is welded to the sash. There is nothing in its construction to cause it to stick, bind or break.

Specifications

All sash shall be Mesker's as made by MESKER BROS. IRON CO., St. Louis, Mo. All muntin bars shall be made from solid rolled steel sections $1\frac{1}{2}$ in. deep. The vertical or horizontal bar must be solid. *No cut outs* of any kind. All joints and intersections shall be formed by a dovetail wedge and mitre which is to be locked into place and thoroughly *arc welded*.

All ventilators shall be horizontally pivoted by means of our standard pivot unless otherwise specified. $\frac{3}{8}$ -in. lap weathering shall be employed at all points of contact except at bottom where two point contact shall be used. Double contact throughout can be furnished if so specified.

Hardware—Push bars are to be furnished with all ventilators unless otherwise specified. Ventilators inaccessible to the floor shall be operated by cam lock and chain unless otherwise specified.

Mullions—Vertical mullions shall be Mesker patented tongue and groove type, made from open hearth steel plates.

Painting—All sash and mullions to be given one dip coat of grey mineral paint before shipping.

Glazing—All glazing to be done under another contract.

The Mesker Architectural Sash with Reversible Extending Ventilators

Utility—The great advantage in the adoption of the Mesker Cruciform Steel Sections is seen in their application to the Architectural type sash with reversible extending ventilators, illustrated on this page.

Besides the larger sash units permissible by the use of these heavy steel sections, the ventilators and glass are arranged for more artistic designing to harmonize with finer class of building, as well as for architectural beauty.

Ventilation—The Mesker Reversible Extending Ventilators are a wonderful improvement over the center pivoted industrial type. They are balanced on a pair of extending arms and secured to vertically sliding bronze friction shoes which perfectly function for the smoothest action of the reversible ventilator. Double contact weathering obtains all around the ventilator opening, and the extending side arms are entirely concealed when ventilator is closed.

Mesker Cruciform Reversible Sash

Installed in east and west elevations of St. Louis University High School. 900 lineal feet

Outside Glazing—(See second preceding page.) Outside glazing minimizes the exposure of metal to weather, thereby reducing the possibility of rust or corrosion, and almost entirely eliminates painting and maintenance expense.

Outside glazing develops the greatest opportunity for interior color finish and for decorative art.

Inside or Outside Glazing (Patent Applied For)—Mesker Sash, constructed of cruciform or standard steel sections, are adapted for either inside or outside glazing as preferred by the owner, when ordering, at small extra cost.

The new and improved architectural tongue and groove mullions are standard with either type of glazing, but can be improved with inside cover plate.

Dimensions—The unit sizes vary slightly from the Mesker Standard Industrial Type. By conforming to these sizes, the window designer will be assisted in his lighting layout—with the use of Mesker tongue and groove mullions for openings of any dimensions required for large or small buildings.

Mesker Fireproof Hollow Metal Windows

Approved by the National Board of Fire Underwriters. Suitable for new and old buildings. Designed along the same lines and contain the same glass area as wood windows. Frames and sash of No. 24 gauge galvanized steel or 20-oz. copper. Concreting of subsill must be done at building.

Underwriters' label is a guarantee that windows comply with every requirement and are accepted everywhere by rating bureaus as standard. Removal and replacement of sash is accomplished as easily as in wood windows, an important cost factor.

Glass—Must not exceed 720 sq. in. exposed area per light and no light longer than 54 in., except for windows in street elevations where such light is limited to 2916 sq. in.

Transoms—Hinged, pivoted or stationary types may be used over all windows or multiples. Transom bars are all sheet metal for windows 10 ft. high and under.

Mesker Solid Metal Window Double Hung and Counterbalanced Labeled and Non-labeled

Double Hung—Construction—Frames are made of No. 16 gauge or heavier, if required, to No. 20 gauge blue annealed steel, No. 24 gauge galvanized steel, or from 18 oz. to 48 oz. cold rolled copper.

Sash—Are of solid rolled steel, or bronze No. 10 gauge.

Glass—Large lights are permitted in non-labeled windows secured in place with steel glazing clips and putty.

Access—To weights is obtained by removing the grooved plates in the jambs.

Underwriters' Labeled Windows—Have frames of No. 15 gauge blue annealed steel or No. 24 gauge galvanized steel.

Sash—Are of solid rolled steel. The windows are specially designed and constructed to meet the requirement of the National Board of Fire Underwriters' specifications and their label is attached to each window.

Glass—Is held in place with steel glazing angles.

Counterbalanced Windows—Are made of same material as the double hung. They have no sash weights but the two sashes are balanced one against the other, supported by chains running over pulleys in the window head.

Practical in operation, they give ready ventilation, when needed, through openings at the head and sill simultaneously. They are absolutely weather-proof when closed and locked.

Federal Welded Solid Steel Pivoted Windows

Federal Welded Solid Steel Pivoted Windows

Federal construction of solid rolled copper steel with welded joints insures not only the greatest possible strength, but what is equally important, a window absolutely square and true; one which cannot be racked out of shape by careless and rough handling or warped by settlement of the building walls or foundation.

All joints are welded, making the window one complete steel structure. The individual pieces are assembled in a fixed form before joints are welded, insuring perfect squareness and accurate dimensions.

The weather side, which withstands the action of the elements, is flush and smooth. This improves the appearance of the windows and prevents dirt, dust and moisture collecting, and the resulting corrosion of steel.

Ventilator Operation

—By push bar or cam latch and chain, as desired. The push bar is attached to the ventilator by a substantial double hinge. When closed, bar folds back against the window, slips over a locking piece and securely locks the ventilator. The cam latch is operated by a chain over a roller at the head of the ventilator.

Underwriters' Labeled Windows—Underwriters' windows with glazing angles are furnished in this type.

Federal Welded Solid Steel Store Front Windows

Federal Welded Solid Steel Store Front Windows

Made of solid rolled steel, all joints electrically arc-welded into one solid structure, insuring a rigid unit and eliminating glass breakage. Gives maximum light and reduces area of plate glass required.

All ventilators double weathered with pole operated latches. Can be screened without interfering with ventilator.

Have no ledges or projections to collect dirt or moisture or interfere with painting. Can be combined by adding mullions to give combinations to meet local conditions.

Small lights held by spring wire glazing clips and steel window putty. Large plate glass is back puttied and secured by continuous glazing angles firmly screwed to the frame members.

Federal Welded Solid Steel Ridge Ventilated Skylights

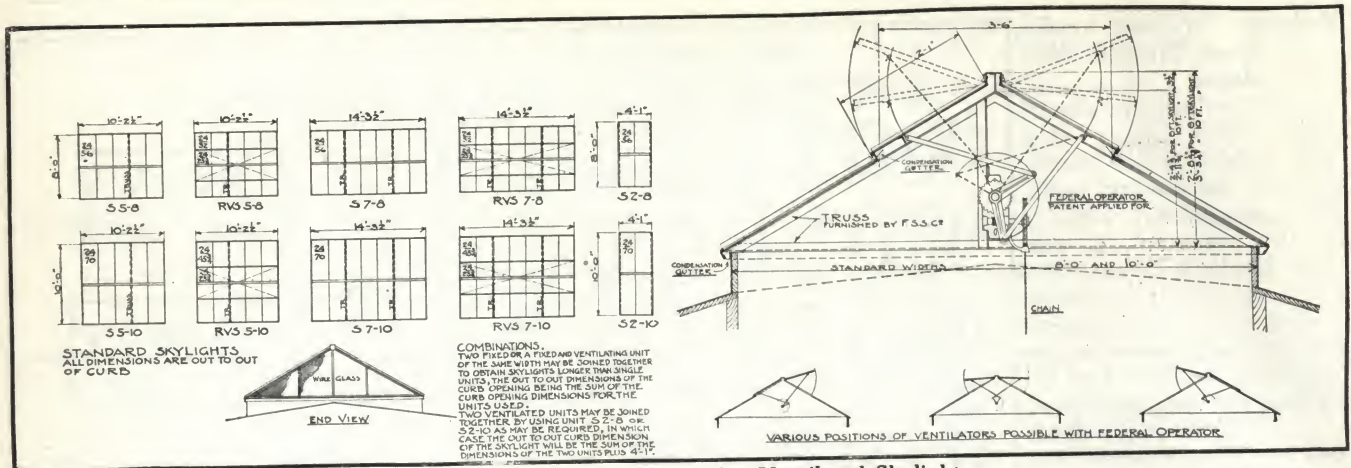

Will not rack out of shape, warp, bind or shrink. Always square and true, eliminating glass breakage. End panels are glazed, giving additional lighting.

Operators, in the case of ventilated units, control both leaves with the motion of the chain in one direction only, giving any of the positions shown.

Easily and quickly erected with ordinary tools and without skilled labor.

Glazed from the outside with continuous glass stops provided at the bottom of the lights.

Shipped complete (except for glass) including condensation gutters, all screws, bolts, etc., needed for erection, also complete erection instructions and diagrams.

Federal Welded Solid Steel Ridge Ventilated Skylights

Federal Welded Solid Steel Commercial and Architectural Projected Windows

Designed for public and semipublic buildings, such as hospitals, courthouses, schools, libraries, hotels, apartment buildings and similar structures. They have all the advantages of the solid steel pivoted windows and at the same time their lines permit the architect to give a pleasing effect to the window openings. Ventilators open from the head down and project from the sill out. The head of the ventilator is also provided with a wide drip plate.

Small ventilators at sill are bottom hinged, swing in, with stay bars at each jamb, which construction prevents direct draft at the sill when ventilator is open.

Federal Welded Solid Steel Basement Windows

The same rigid design. Shipped complete with glazing clips, cam lock and mason guides.

Made in the following sizes:

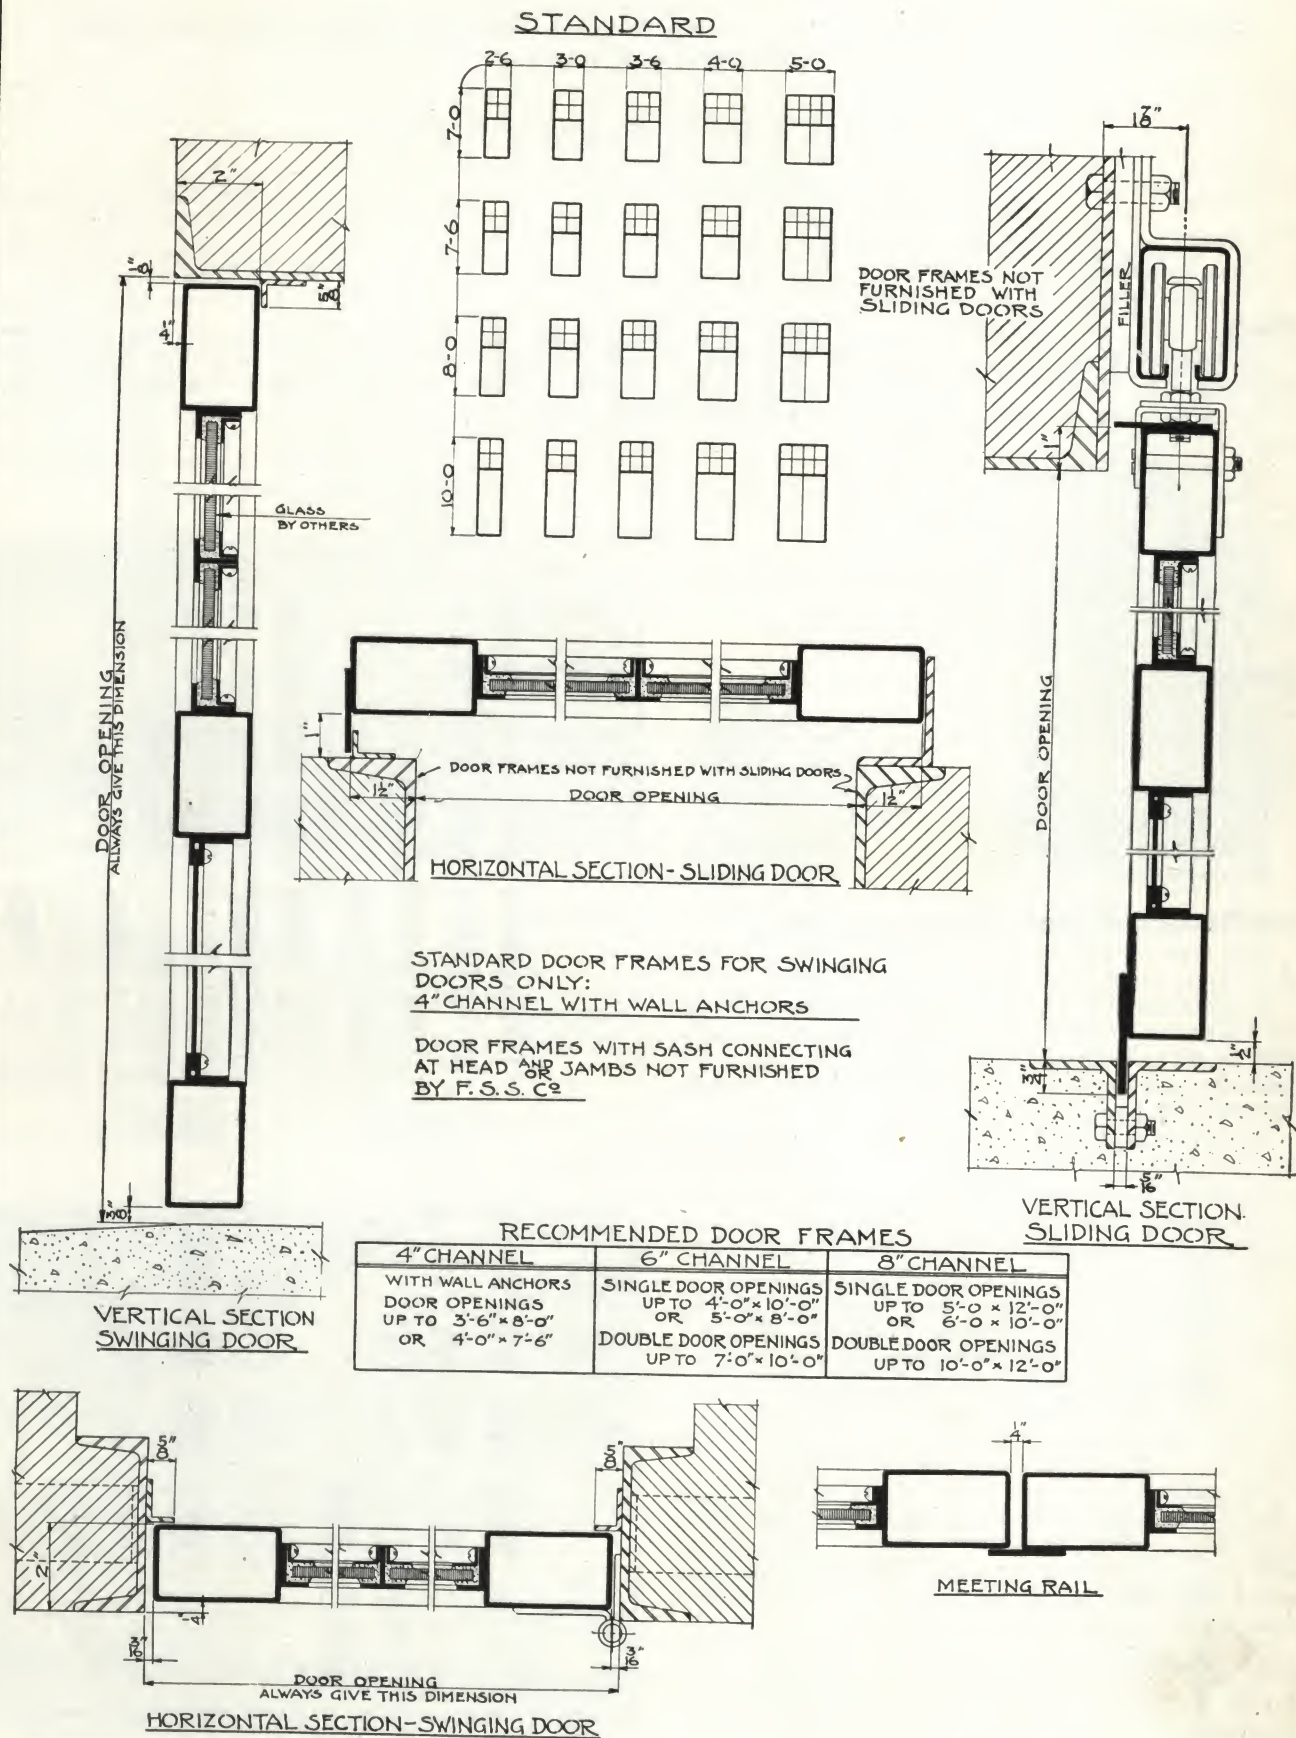

3-light, 10x12-in. glass. 3-light, 10x20-in. glass.
3-light, 10x16-in. glass. 2-light, 14x20-in. glass.

Federal Welded Industrial Doors

Made in both swinging and sliding types from drawn steel tubing, with all corners mitered and all joints electric-welded.

See illustration for details.

Thorn Standard Pivoted Sidewall Steel Sash

This type of window is for use in factories, mills, powerhouses, garages, etc.

Made of solid rolled steel moulded members $1\frac{3}{8}$ in. deep. Muntins at intersections are mitered and electrically welded, making neat flush joints of pleasing appearance, and a very rigid sash that will not easily be racked out of square.

Ventilators in standard sash are pivoted 2 in. above center on heavy wrought iron hinges double riveted to sash members, and form a double contact weathering at top, bottom and sides. Ventilators within reach of floor are operated by stay bar, and those higher up are controlled by spring catch and chain.

The jamb members of all standard sash are punched with horizontally slotted holes for connection to T-bar mullions when used in openings requiring two or more units. The T-bar mullions have vertically slotted holes, and can be readily attached outside the sash with stem projecting either inward or outward. The necessary bolts and washers are furnished with mullions.

Standard sash are furnished only in 12x18 and 14x20-in. glass sizes. These glass sizes, however, occur only in the stationary portion of the sash. In the ventilators, all the lights at the top and bottom are 1 in. shorter, and all the lights at the sides are 1 in. narrower than in the stationary portion of the sash.

Thorn standard pivoted sash are given one shop coat of paint. Two additional coats of paint should be given all sash after erection. Before glazing, all hardware should be applied to ventilators, and should operate properly. Each light of glass is held by four spring clips, which are furnished with the sash.

Dimensions of sash shown are measured from a

THORN

STEEL WINDOWS

point $\frac{1}{2}$ in. in from the edge of the out-standing leg, and wall openings should be held to these dimensions. Where mullions occur, add 2 in. for each mullion.

In openings where mullions occur add 2" for each mullion

Shaded units carried in stock assembled ready for immediate shipment. Other units carried in stock in knocked down condition ready for assembly.

Thorn Standard Pivoted Steel Sash

Thorn Underwriters' Pivoted Sash

Thorn standard pivoted sash bearing the Underwriters' label can be furnished in any type not exceeding 7x12 ft., either dimension being taken as width or height.

These sash must have continuous glazing angles and special clips on ventilators, and are inspected and labeled before leaving factory.

These sash must be glazed with $\frac{1}{4}$ -in. wire glass.

Thorn Projected Steel Sash

Designed for use in schools, hospitals, offices, banks, apartments, etc.

Ventilators are arranged to slide on pivots with friction adjustment, and held in perfect balance by side arms.

Ventilators are made to open in at top or out at bottom, and can be made reversible to permit washing from the inside of building.

Ventilators in projected type sash should not exceed 36 in. in width and 34 in. in height.

Thorn Projected Steel Sash

Thorn Continuous Steel Sash

Designed for monitors, sawtooth construction and sidewalls of foundries, forge shops, powerhouses, and other heat and gas producing buildings.

Made of special solid rolled steel sections and hung on heavy malleable iron hinges.

Standard panels carried in stock 3, 4, 5 and 6 ft. high, that will make up any continuous length. End

Typical Installation of Thorn Steel Sash

Thorn standard pivoted steel sash in sidewall, also Thorn continuous steel sash and Thorn sash operating device in monitor

panels and storm panels keep rain from entering building while sash are open.

All joints are riveted and welded.

Thorn Sash Operating Devices

Thorn worm and gear rocker arm operator is furnished for operating short runs of pivoted sidewall sash, manually.

Thorn tension pivoted sash operator is designed for operating long runs of pivoted sidewall sash, either manually or electrically.

Thorn continuous sash operator is designed for use on long runs of top hung Thorn continuous sash, and can be operated either manually or electrically.

All parts of the tension devices are of wrought steel and malleable iron, and all gears are cut steel. All motor driven devices are equipped with automatic limit switches.

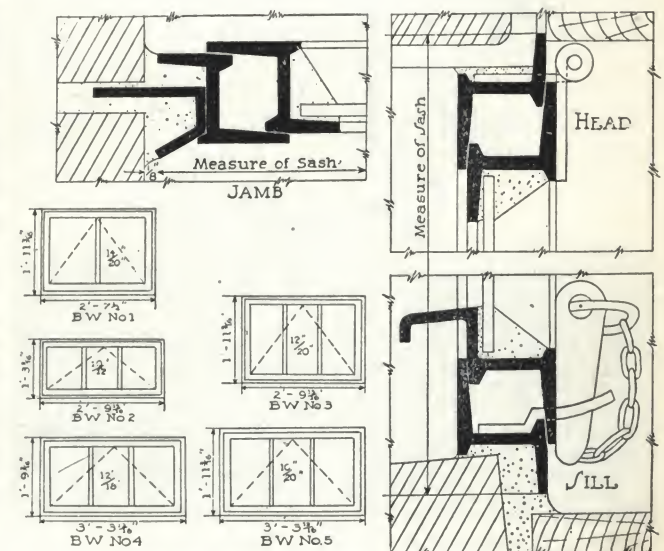

Idler

Thorn Motor Driven Power

Thorn Steel Basement Sash

Made from specially rolled casement sections, which form a double contact weathering. Shipped with all hardware attached ready for installation. Give more daylight than wood windows, are fireproof, and will not warp, swell or stick. Cost compares very favorably with wood. Standard types shown below.

TRUSCON STEEL COMPANY

Manufacturers of Steel Windows and Doors

YOUNGSTOWN, OHIO

WAREHOUSES AND OFFICES IN ALL PRINCIPAL CITIES

RAILROAD DEPARTMENT, 228 North La Salle Street, CHICAGO, ILL. FOREIGN TRADE DIVISION, 90 West Street, NEW YORK, N. Y.
TRUSSED CONCRETE STEEL COMPANY OF CANADA, LIMITED, WALKERVILLE, ONT.

The Truscon Line

Truscon manufactures a complete line of STEEL WINDOWS and STEEL DOORS for industrial, commercial, public and residential buildings. The completeness of the Truscon Line offers great latitude of selection and application.

TRUSCON SASH OPERATORS, hand and power.

For Concrete Reinforcement, see pages A134-135; for Steel Roof Decks, see page A171; for Steel Joists, see page A578; for Metal Lath, etc., see pages B1306-1307.

Truscon Horizontally Pivoted Windows

For use in factory buildings, warehouses, public and private garages, store and loft buildings, inexpensive schoolhouses, gymnasiums, manual training rooms and, in general, where an inexpensive steel window is needed.

Construction Features of Pivoted Windows

- (1) Roller bracket at head of ventilator—permits use of chain operators on windows out of hand reach.
- (2) Inside glazing with spring steel glazing clips, makes glazing easy and glass replacements simple.
- (3 and 4) Double contact weathering at head and jambs assures protection from rain and wind.
- (5) Solid steel pivots with removable pins mean life-long operating service.
- (6) Dovetail miter joints at intersections of muntins give strength and rigidity to the windows.
- (7) Heavy, close fitting jamb and sill sections, mean windows that will withstand the hardest service.
- (8, 9 and 10) Three types of hardware to select from meet every building requirement.

TRUSCON
STEEL WINDOWS
TRADE-MARK

Truscon Continuous Steel Windows

For maximum daylight and positive control of ventilation in industrial buildings having sawtooth or monitor type roofs. All types of Truscon Continuous Steel Windows may be operated with hand or mechanical operators.

Truscon experts will gladly co-operate with architects in securing the most practical and economical installation.

Construction Details of Top Hung Continuous Windows

- (1) Welded mortise and tenon joint prevents twisting.
- (2) Hinge member forming continuous bearing gives perfect weathering.
- (3) Heavy brass glazing clips on vertical muntin bars.
- (4) Wide flange for attachment of mechanical operator.
- (5) Mortise and tenon joint showing welding.
- (6) Showing glass embedded in putty.

Specifications and Drafting Room Standards

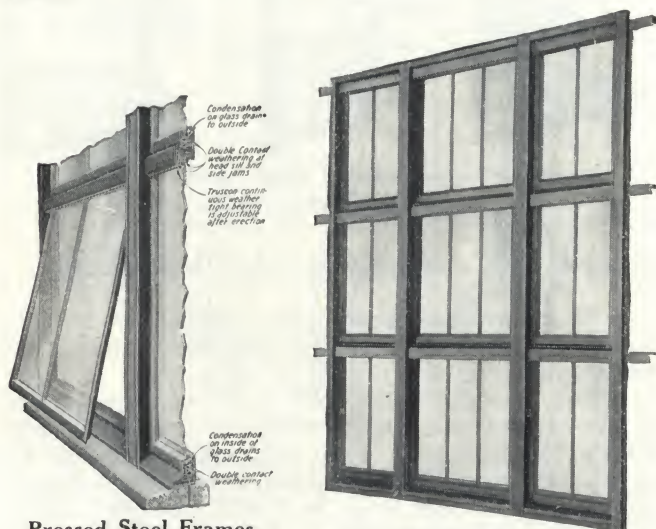

Specifications and drafting room standards free on request.

Truscon Pressed Steel Frames

In modern power house design, the architectural effect most sought after is that of massive strength. Truscon pressed steel frames, used in conjunction with either pivoted windows, projected windows or continuous top hung sash, harmonize perfectly with the massive lines of this and other types of monumental architecture, and though light in weight, their scientific construction is such that they have all the strength, permanence and dependability which their appearance suggests.

Of extra gauge rust resisting copper-alloy steel, Truscon Pressed Steel Frames are practically indestructible. The contours of the frames are absolutely uniform because of the heavy dies used in building them, an important factor in reducing the cost.

Truscon Pressed Steel Frames have the Truscon continuous type hinge, an exclusive feature. No flashing is required. Double contact weathering throughout and slotted holes which permit easy adjustment of the weathering members, assure absolute tightness of the frame.

Pressed Steel Frames
Sectional view through typical panel with continuous sash

Truscon Pressed Steel Frames with Truscon Steel Windows

Truscon Mechanical Operators (Hand and Power)

All types of hand and power operators are included in the Truscon line which has been steadily developed over a quarter century. Positive and prompt control of sidewall and monitor units is always assured with Truscon Operators.

Each Truscon Operator is low in initial cost and is low in maintenance, because designed to give satis-

factory service even when neglected over long periods of time.

Truscon operator specialists will gladly confer with architects and engineers on the proper type for any specific installation.

Types—Truscon Mechanical Operators include torsion type operators for center pivoted sash in runs up to 120 and 220 ft. Torsion type for group control of center pivoted ventilators, Type "C" rack and pinion operators for pivoted ventilators in standard windows or short runs of continuous sash and for runs up to 400 ft.

Any special problem can be solved by Truscon's skilled experts.

Tension Type Operator Duplex Power

Tension Type Operator Hand Power

Torsion Type Operator Hand Power

Truscon Industrial Type Doors

Truscon is equipped to manufacture steel doors of any desired size, in either fold, swing or lift types, for railroad shops, pier warehouses, airplane hangars and other buildings which require unusually large doors to meet specialized working conditions.

Specifications and Drafting Room Standards

Specifications and drafting room standards free on request.

Four Runs of Continuous Windows All Electrically and Independently Controlled

Folding Type, Railroad Steel Doors

Truscon Projected Windows, Architectural Type

Truscon Projected Windows are built in two types, the Architectural and the Commercial. The Architectural type is especially designed for buildings of massive, monumental proportions. Its outside frame is a heavy channel and all corners of the frame are welded and ground. They are completely weathertight. The ventilators are formed of hot rolled angle members. The elimination of needless joints and cracks so common in built-up sections of light gauge metal increases the strength of the units. Resistance to rust and corrosion is assured by Truscon copper-alloy steel and the use of strong, rigid, but slender sections secures maximum daylighting. Adjustable ventilators give complete control of ventilation.

Architectural Type, Projected Steel Window

Commercial Type, Projected Steel Window

Truscon Projected Windows, Commercial Type

The Commercial type of Truscon Projected Window is regularly used for the office sections of structures housing both plant and office. The glass size of this type of window is the same as that of Truscon Standard Factory Sash, so that there is no break in the uniformity of the exterior architectural effect.

These windows may be kept open even in wind and rain since the tilted ventilator eliminates direct drafts. When open, it acts as a deflector and effects a continuous change of air.

The frame of the ventilator is welded at the pivot corners.

All hardware is sherardized malleable iron. Outward opening ventilators within reach of floor have cam latch handle. Those not easily accessible have pole hole ring in addition. Those opening inward have automatic spring latch.

Truscon-Built Donovan Awning Type Windows

Designed by John J. Donovan, a national authority on school architecture, the Truscon-Built Donovan Window provides the schoolroom with properly diffused sunlight and accurate ventilation control. Its success in this field has led to the adoption of Donovan Windows for many other types of buildings such as hospitals, offices and public structures of a similar nature.

Construction and Operation—The frame opening of the Donovan Window is divided into three sashes. These open outward in parallel and do not protrude into the room. Thus, in this design, the ventilating possibilities of each window are 100% of the window opening and, at the same time, can be controlled to any degree. Horizontal and downward drafts are avoided without the usual sacrifice of fresh air, by deflecting all air currents upward; and the awning-like operation of the sash protects the interior against rain without necessitating the closing of the windows. Nor does shading impede ventilation, because individual shades are attached to each separate sash and the shade and sash operate as a unit.

The Donovan Window is simple in construction, yet strong and durable. It is so perfectly balanced that a child can open or close all sashes in one simple motion without the use of window poles or heavy hand lifting and pulling. Both sides of the glass are easily and quickly cleaned from within.

Built of copper-alloy steel, it is thoroughly protected against rust or corrosion and reduces fire risk to a minimum.

The Donovan Window permits the use of large glass areas to harmonize with any type of architectural treatment.

Donovan Awning Type Windows

A few of the numerous sash positions obtainable for the purpose of directing air currents and diffusing the direct rays of the sun

Truscon Solid Steel Model "A" Double-Hung Windows

These windows have been designed to combine beauty with durability, strength, practical simplicity and fireproofness.

They are single unit solid frame windows welded at all corners to insure weathertightness, solidity, rigidity and perfect alignment. Sash rails and muntin bars are unusually heavy. Perfect jamb slots are provided—absolutely true and even in width. Double contact weathering with air channels prohibits capillary or molecular attraction at all points.

Construction throughout is of permanent copper-alloy steel and high quality hardware accompanies each window. Recesses in back of frame assure perfect bond with masonry.

Construction Features of Double-Hung Windows

- (1) Concealed roller bearing pulley.
- (2) Concealed chains.
- (3) Weathertight meeting rail, sash guides, head and sill.
- (4) Frame welded at corners—rigid and solid, no bolts, and weathertight.
- (5) Weights accessible through opening provided with weathertight cover.
- (6) All exposed metal No. 12 gauge or heavier.
- (7) Weathertight frame.
- (8) Sash made up with heavy hot rolled sections—therefore strong and durable.
- (9) Handle (two if desired) for lowering upper sash.
- (10) A complete sweep lock.
- (11) Two lifting handles.
- (12) Window pole socket.

Specifications and Drafting Room Standards

Specifications and drafting room standards free on request.

Truscon Casement Windows

Constant improvements in design and manufacture have resulted in low priced copper-steel casement windows which are both beautiful and practical, and well suited for apartments and residences.

They open and close easily, never stick, warp or get out of line. Moreover, they open outward, offering 100% ventilation without interfering with screens or drapes within. They are fireproof and permanent—but no more expensive than the ordinary wooden window.

Construction Features Casement Windows

- (1) Adjustable friction stay holds casement open in any desired position.
- (2) Vertical mullion provides neat paneled appearance inside.
- (3) Steel push bar can be furnished with BT-114 unit.
- (4) Continuous head drip insures proper weathering.
- (5) Transom bar used when two or more units are combined one above the other, forming a drip over lower sash and providing rigidity in combination of units.
- (6) Cam handles furnished in malleable iron for both right and left hand. Solid bronze handles of same design if desired.
- (7) Flexo-Stay adjuster, for use under screen, operates the casement from the inside without opening screen.
- (8) Continuous subsill section provides extra weather protection at the sill.
- (9) Corners of frame are mitered and electrically welded with the welds inside concealed from view.
- (10) Corners of sash welded same as frame.
- (11) Spring wire glazing clips hold glass any thickness firmly in place. Outside glazing gives neat interior finish.
- (12) Jamb angle provides secure anchorage into masonry wall construction.
- (13) Cleaning hinges are supplied if desired.
- (14) Standard heavy hinges are spot-welded to frame and sash.
- (15) Anchored in any type of wall construction

Truscon Casement Doors

Truscon Steel Casement Doors, specially designed for use in conjunction with Truscon Casement Windows, are practical and beautiful for porch and terrace, or as connecting doors to solariums and conservatories.

Truscon Basement Windows

Copper-steel basement windows always open and close easily, lock securely, never stick, leak or need repairs.

They are permanent, durable and trim-looking in appearance.

Construction Features Basement Windows

- Head—double contact weathering; overhanging drip.
 Sill—protective overhanging drip; double contact.
 Jamb—double contact weathering; protruding fin for anchorage, inside and outside leg masonry guide.
 Hook type pinless hinge, ventilator hooks on keeper welded on frame, ventilator easily removed.
 Rigid corners, continuous outside frame; extremely rigid corners, windows will not distort.
 Cam-acting latch, positive lock; foolproof and easy to operate

Truscon Stock Doors

For use in factories, warehouses, depots, public garages and wherever sturdy, fireproof doors are desired. Made in either single or double slide or swing types in sizes to meet practically all requirements.

Construction Features Stock Doors

- (1) Astragal used at meeting rail.
- (2) Offset hinge—Reversible for in-swinging or out-swinging doors.
- (3) Lever latch and padlock (Set B). Mortise cylinder lock (Set A).
- (4) Internal reinforcing of corners.
- (5) Muntin. Glazing angles hold glass in place.
- (6) Hook back and ring to hold doors open. Lock bolt and socket for inside locking.
- (7) Pressed steel door frame anchored in wall construction.
- (8) Section through rail of door at jamb.
- (9) Assembling of door frame and adjustable tee anchor.
- (10) Chain bolt used at top of doors.

Specifications and Drafting Room Standards

THE AIROLITE COMPANY

FORMERLY THE WINDOW-WALL COMPANY

Manufacturers of Natural Air Ventilating Equipment

MARIETTA, OHIO

Products

THE WINDOW-WALL UNIT, a patented type of window and wall construction for bedrooms and sleeping porches built in combination with either double hung or casement windows.

"AIROLITE" ADJUSTABLE WINDOW VENTILATORS.

"AIROLITE" STEEL SASH VENTILATORS.

"AIROLITE" VENTILATING SASH.

For all kinds of Adjustable and Stationary Louvered Panels for natural air ventilation, see page B1162.

Window-Wall Unit

The Window-Wall Unit is a combination of screen, glass and "Airolite" Ventilating Sash, ideal for sleeping porches, fresh air bedrooms and sun parlors, both in private homes and institutions. Affords protection, ventilation, privacy, comfort, convenience and health to the occupants of any room in which it is installed, and the original cost is only slightly more than the cost of an ordinary window. With Window-Wall, no awnings, inside window blinds or drapes are necessary. In other words, with Window-Wall you live outdoors with indoor protection. It is installed practically the same as an ordinary window.

The Window-Wall Unit consists of a wooden frame, a screen which is hung on the outside, a set of glass sash, a set of "Airolite" Adjustable Ventilating Sash and a tuck-away pocket with hinged sill. When the glass and "Airolite" Sash are lowered into the tuck-away pocket, a screened opening effect is obtained.

With the glass sash run up into place, you have a regular window or sun parlor. With the "Airolite" Sash raised and the glass sash lowered you have an all-year, open air, sleeping room. Both glass and "Airolite" Sash can be run up into place at the same time. By this arrangement the "Airolite" Sash serves as an awning or shade. The steel louvers can be tilted or adjusted to keep out excessive sunlight and at the same time retain absolute privacy.

Window-Wall Unit with Double Hung Sash as It Appears When Installed

Window-Wall Sleeping Porch, in Use More Than Ten Years in Home of W. R. Metcalf, Marietta, Ohio

Mr. Metcalf Says:
"I would give up the rest of the house before I would my Window-Wall Sleeping Porch. We sleep in the fresh air every night, regardless of the weather and the Window-Wall is the only thing I ever heard of that will permit of this and at the same time give you proper protection. I am strong for the Window-Wall."

Suggested Window-Wall Specifications for Architects' Use

(For insertion in Carpentry section.)

Specifications vary with the designs and construction desired. The following specifications cover all items, which may be segregated and used to specify construction for double hung windows:

Where indicated on the plans, the [Carpenter] [Contractor] shall furnish and install Window-Wall Units as manufactured by THE AIROLITE COMPANY, Marietta, Ohio.

Each Window-Wall Unit as shipped by the manufacturer shall consist of a substantially constructed wood framework built with window openings, each unit built up by framing pulley jambs (with pulleys, outside blind stops and parting stops), head jamb, weather pan board and copper weather pan in the proper manner. This does not include any interior or exterior trim.

The following material shall be furnished by the manufacturer and be installed by the [Carpenter] [Contractor].

One pair double hung, metal louvered "Airolite" Adjustable Ventilating Sash (louvers to be finished in standard baked enamel paint, olive green color; frames, three coats air-dried enamel paint, olive green color.)

One pair double hung glazed sash, one full length copper wire screen, outside sill, hinged sill, inside sill, sash weights and weight guides.

One pair sill hinges, one pair copper drain tubes and one set full length screen hangers.

The [Carpenter] [Contractor] to leave proper openings to receive Window-Wall Units and to furnish all labor and material required to install these units in first class workmanlike manner and in line with all exterior and interior construction.

The details in the next column are for frame construction, also for stucco if 1½-in. casing is used. For casement windows, brick or other construction write for detail drawings.

Widths

Glass size, in.	Over-all glass sash, in.	*Over-all clearance required between studding or structure opening, in.
20 in.—One-light wide . .	24	31 $\frac{3}{4}$
22 in.—One-light wide . .	26	33 $\frac{3}{4}$
24 in.—One-light wide . .	28	35 $\frac{3}{4}$
26 in.—One-light wide . .	30	37 $\frac{3}{4}$
28 in.—One-light wide . .	32	39 $\frac{3}{4}$
30 in.—One-light wide . .	34	41 $\frac{3}{4}$
32 in.—One-light wide . .	36	43 $\frac{3}{4}$
18 in.—Two-lights wide . .	41	48 $\frac{3}{4}$
20 in.—Two-lights wide . .	45	52 $\frac{3}{4}$
22 in.—Two-lights wide . .	49	56 $\frac{3}{4}$
24 in.—Two-lights wide . .	53	60 $\frac{3}{4}$

Note: For brick construction, etc., where weight boxes are required, add 1½ in. to the above dimensions on over-all width clearance required.

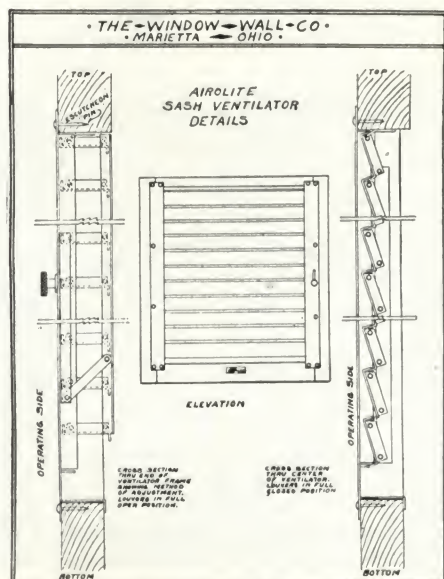

Mullion Casing: When the Window-Wall Units are to be installed with mullions between units, the ground casing and finished interior casing fitting between the units will each be 10% in. wide. This will be increased by 1½ in. when used in brick or masonry walls.

Heights

Glass size, in.	Over-all glass sash, in.	Floor line to top of inside sill, in.	Over-all clearance required between floor line and headers, in.
20	46 $\frac{3}{4}$	31 $\frac{1}{16}$	78 $\frac{5}{8}$
22	50 $\frac{3}{4}$	33 $\frac{1}{16}$	84 $\frac{5}{8}$
24	54 $\frac{3}{4}$	35 $\frac{1}{16}$	90 $\frac{5}{8}$
26	58 $\frac{3}{4}$	37 $\frac{1}{16}$	96 $\frac{5}{8}$
28	62 $\frac{3}{4}$	39 $\frac{1}{16}$	102 $\frac{5}{8}$
30	66 $\frac{3}{4}$	41 $\frac{1}{16}$	108 $\frac{5}{8}$

Caution: The above dimensions cover the actual openings required to receive the Window-Wall Unit. Take care of top and side trim. "Aiolrite" Ventilating Sash, Glazed Sash and Screen are the same in width.

"Airolite" Sash is a patented ventilator constructed with wood frame and adjustable louvers, made of rust resisting steel, each louver having a $\frac{1}{4}$ -in. flange. A slight pressure of the thumbscrew sets the louvers at any desired angle, quickly and silently, thus affording privacy, shade or light as desired, fresh air without draughts and protection against storms. While "Airolite" Sash is used as part of the Window-Wall Unit it can be installed as a separate unit in old and new construction as ordinary double hung glazed sash, as full length screen, or as half sash to fit against outside blind stops and flush against upper glass meeting rail; the bottom to rest upon the main sill. "Airolite" Sash can be supplied with or without screen. When screen is desired, we use 16-mesh copper wire cloth. On large sizes, the "Airolite" Sash is divided up into various size lights.

DAVID LEVOW

"Fitrite" Skylight Gearing and "Fitrite" Bronze Strainers

TELEPHONE
CHELSEA 2400

542 West 23rd Street

NEW YORK, N. Y.

"Fitrite" Skylight Gearing

Features—Instead of the usual round pipe holes (where the only point of contact is at the setscrew),

"Fitrite" Skylight Gearing has special oval pipe holes on arms and lifting gear.

The result is a much firmer grip (contact at *three* points instead of one) and absolute freedom from rattling in any position.

Material—Made in both best quality gray iron and in solid bronze, which is rustproof and harmonizes with copper skylights.

Sizes—Made for standard 1/2-in. pipe size.

Also furnished in 3/8-in. pipe size for smaller skylights.

Type "M"—For single skylights or concrete work. Type "M" requires no horizontal piping. It is therefore suitable for small skylights and for installation in concrete buildings.

Type "M" requires no extensions, thus eliminating the problem of fastening extensions to concrete walls.

"Fitrite" Bronze Gearing is especially recommended (1) for industrial buildings as it resists corrosion due to chemical fumes, acids, etc., (2) for laundries, kitchens or wherever excessive moisture causes iron to rust away. The slight extra cost of "Fitrite" Bronze Gearing assures a permanent trouble-free job.

"Fitrite" Roof Strainers—for Flat Roofs Having Inside Cast Iron Leaders

Type F—Perfectly flat. Extensively used for roofs and roof gardens requiring freedom from all obstruction; also for swimming pools.

Type R—The slight crown (1 in. high) does not seriously obstruct the roof, yet the construction is such that debris slides off easily. Especially recommended for flat tile or slag roofs having inside leaders, at center of roof.

Type X—Recommended where drainage efficiency is the prime consideration. The extra high crown (3 1/2 in.) and narrow slits effectively keep out gravel, sticks, etc. Type X is especially desirable where leaders are at edge of roof.

Materials—All types made in solid bronze.

Features—"Fitrite" bronze strainers are about 1/4 in. thick, will not rust, and are practically unbreakable—will easily support the weight of three husky men. Each strainer has two hinges allowing easy attachment by copper strip to leader box.

Type F

LORD & BURNHAM CO.

Manufacturers of Sash Operating Apparatus for Hinged and Pivoted Sash
IRVINGTON-ON-HUDSON, N. Y.

Products

SASH OPERATING APPARATUS in various styles and sizes for Operating Hinged and Pivoted Sash in factories, foundries, car barns, roundhouses, powerhouses, machinshops, steamers, banks, churches, prisons, greenhouses, also for Heavy Transoms in such places as store fronts, hotels, public buildings, etc.

For Greenhouses, see pages C3422-3425.

Rocker Shaft Apparatus

Our standard apparatus (Fig. 1) consists of a worm and gear to turn a rocker shaft, to which are attached arms that, in turn, act directly on the sash through suitable rods. Arms are secured to shaft by combined bolting and setscrew cap, or by setscrew only if desired.

Fig. 1. Rocker Shaft Apparatus

Rack and Pinion Apparatus

This type of apparatus (Fig. 2) is intended primarily for long runs of heavy hinged sash. On account of the small pitch radius of the pinion ($1\frac{1}{2}$ in.) the leverage on shaft is so much reduced that torsion in the shaft is reduced to a minimum. The simplicity of this apparatus is a strong point in its favor. The direct horizontal thrust given to the sash prevents all harmful strains.

Fig. 2. Rack and Pinion Apparatus

Screw Thread Transom Operators

Transom operators (Fig. 3) made in 2 sizes: No. 1 for heavy and No. 2 for extra heavy transoms. This apparatus consists of two enclosed miter gears, one of which is threaded and engages with a vertical rod linked to a rocker shaft at bottom of transom, thus allowing it to be supported by an arm and rod at either end, relieving it of all injurious strains, and holding it rigidly in position against wind pressure.

Fig. 3. Screw Thread Transom Operators

Tension Lever Apparatus

Fig. 4 for runs too long or too heavy for practical operation with either our rocker shaft or rack and pinion type. Special circular on request.

Fig. 4. Tension Lever Apparatus

Erection

Full directions for erecting are sent with apparatus so that it can be easily installed by any mechanic.

Estimates and Co-operative Service

On receipt of data giving description of sash and that part of the building where it is intended to install the apparatus, we will gladly submit sketches, suggestions, and estimates for furnishing our stock apparatus, or one specially designed to meet unusual conditions; also, estimates for erecting the apparatus when desired.

Catalogue

Catalogue giving full and detailed description of each apparatus sent on request.

ESTABLISHED 1875

THE PAYSON MANUFACTURING COMPANY

Manufacturers of Sash Operating Devices and Builders' Hardware

2920 Jackson Boulevard
CHICAGO, ILL.

Products

SASH OPERATING DEVICES.

Also manufacturers of: Simplex Transom Lifter, for all types of transoms; Casement Adjusters, friction, geared, and thumbscrew control for all types of casement sash; Signal Sash Lock, for double hung windows; No. 49 Harris Concealed Transom Lifter, for transoms where concealed device is required.

Types of Payson Sash Operating Devices

Torsion Type Using Levers to Sash—Ideal, chain control, for pivoted sash.

Superior, hand wheel control, for pivoted sash.

Triumph, hand wheel control, for pivoted sash in monitors, also for store front transoms.

Torsion Type Using Racks and Pinions to Sash—Reliance, chain or hand wheel control, either straight or curved rack, for top hinged or heavy pivoted sash.

Gem, for single top hinged, skylight sash.

Screw Type Using Levers to Sash—Crown, for short runs of bottom hinged sash opening in.

Duplex, for heavy transoms.

Signet (new), for long runs of hinged sash opening in or out.

Tension Types—Peerless, chain control for top hinged continuous steel sash.

Victor chain wheel control for vertically pivoted sash.

Monarch, for short runs of vertically pivoted or side hinged sash.

All types furnished with electric or pneumatic equipment if desired.

Payson Products Give Satisfaction

This list of Payson products is selected with the hope that it may be used freely by architects in writing specifications. The list contains standard articles that are guaranteed to give perfect satisfaction.

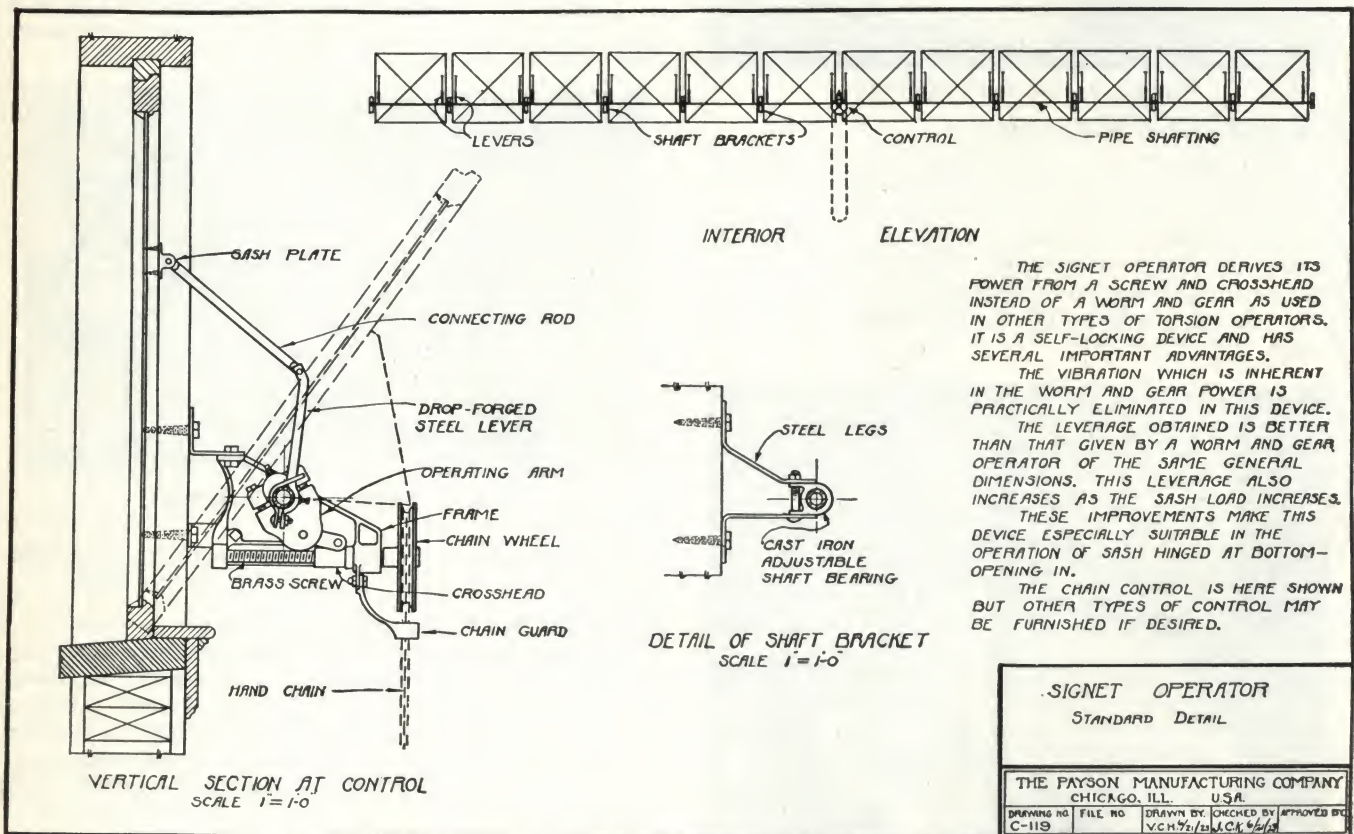

Service

Payson sash operating devices are made to order, using measurements taken from the plans and checked at the building. Every job is exhaustively studied by Payson engineers, and a drawing showing the scheme thought most satisfactory is prepared and submitted to the architect for approval as to layout and general design. After this approval is obtained, if there is any question as to measurements, drawings are forwarded to the building to be checked.

Time is really saved in this way, because the operators can then be erected from the blue print with the certainty that every part will fit the place for which it is intended.

Catalogue

We have a very complete catalogue of Payson products which we would be glad to forward on request.

THE RACK AND PINION OPERATOR AS SHOWN ON THIS PAGE IS THE MOST POWERFUL OF ALL DEVICES COMMONLY KNOWN AS THE TORSION TYPE. THE LEVERAGE IS SO REDUCED THAT THE TORSIONAL STRAIN ON THE OPERATING SHAFT IS VERY SLIGHT.

ITS SIMPLICITY OF ACTION MAKES ITS USE ADVISABLE WHEREVER THE WORK TO BE DONE COMES WITHIN ITS LIMITS.

THE TYPES SHOWN HERE COVER IN A GENERAL WAY PRACTICALLY ALL OF THE CONDITIONS ON WHICH THE DEVICE MAY BE USED TO ADVANTAGE. IN SELECTING THE TYPE DESIRED THE GOVERNING FACTOR IS AMOUNT OF DUTY TO BE PERFORMED. THIS IS BASED ON THE LENGTH OF RUNS, WEIGHT AND STYLE OF SASH AND LOCATION IN BUILDING.

Products

BANK and SAFE DEPOSIT VAULTS and VAULT FRONTS, including: Safe Deposit Boxes, Linings and Complete Equipment; FIREPROOF VAULT DOORS, plate and filled; FIREPROOF SAFES and FILING SAFES; STEEL MONEY CHESTS, rectangular and round doors.

Exclusive Features

Embodied in Diebold Vault Doors, Series 600 and 1000 are three exclusive Diebold features: (1) Diebold Daylight Automatic Lock, protection against daylight holdup; (2) Electric Alarm Grid *built into* the door, connects with any standard electric alarm system and is approved by manufacturers of leading electric alarms.

On all Diebold Bank Vault Doors 7 in. or greater in thickness the Diebold patented Thermatic Locking Device may be installed when requested. Approved by Underwriters Laboratories and National Bureau of Casualty

and Surety Underwriters, it entitles the bank to 10% preferential insurance discount.

65 Years of Successful Safe Building

The recognized quality of the Diebold product is the result of experience as designers, engineers and manufacturers of bank vaults and safes since 1859.

During this period many Diebold safes and vaults have successfully withstood the severest tests, in actual service, as is attested by the many letters on file in this office.

Co-operative Service to Architects

Our Engineering Department, together with the entire personnel of our various branch offices is at the disposal of the architect or contractor.

Sketches and estimates on special work, as well as stock designs will be gladly furnished, without charge.

Bank and Safe Deposit Vaults and Doors Complete Vaults

—Complete Diebold bank vault outfits are in use in many of the largest banks throughout the United States.

These include all styles and sizes from the simplest to the most elaborate.

In this work all necessary equipment such as safe deposit boxes, linings, etc., can be furnished.

Catalog sent upon request.

Burglarproof Vault Fronts—In addition to our lines of standard vault doors described below, we are prepared to build any style or size to meet special or unusual conditions.

Bank Vault Door No. 507

Fireproof Vault Doors

All Diebold fireproof vault doors are designed with removable rear frame, for quick and easy placing after all masonry is completed. All standard single swing doors are right-hand swing; left-hand swing doors built to order.

Single Swing Doors—Style "R" door is constructed of $\frac{3}{8}$ -in. plates and angles mounted on heavy pin hinges. It is equipped with one top, one bottom and four horizontal bolts, bakelite lever handle and Diebold 3-tumbler combination lock with anti-dynamite device. Has folding inner doors equipped with T-handle and flat key lock. Door is painted green with gold striping throughout. Locking bolts, handles, tips, etc., buffed nickel.

Style "S" is similar to Style "R," except for clear opening and wall thickness.

Filled Vault Door—Door No. 154 consists of a $\frac{1}{4}$ -in. front plate backed by $3\frac{3}{4}$ -in. Diebold patent fireproof filling, hung on three heavy pin hinges and equipped with lever bolt handle and 3-tumbler Diebold combination lock. Finished in olive green with gold striping and buffed nickel trim.

Door No. 152 involves a new principle of fireproof vault door construction. An offset $2\frac{1}{2} \times 4$ in. is necessary in the masonry around the outer edge of the wall opening. Attached to the front edge of the vestibule is a specially formed insulated stop which sets into the step provided in the masonry. The spaces formed by the section of the frame forming the stops are filled with insulating material similar to that used in the door. Thus added protection is given to the joint between masonry and vestibule. This door carries Underwriters' Label, Classification 2-hours.

Fireproof Standard Safes

Diebold fireproof safes embody several unusual structural features. The heat-resisting filler, besides furnishing perfect resistance to heat, possesses a high degree of inherent structural strength and thus provides a continuous, solid insulation between the walls of the safe. It retains its fire-resisting qualities regardless of age. The special drillproof plate and the anti-dynamite lever protect the lock and prevent its being tampered with.

Heavy hinges provide easy operation of door and prevent sagging. Outside finish is olive green satin enamel, gold striped; combination dial, spindle, bolt throwing handles and hinge tips are heavily nickelplated.

Key locking inside doors are provided at small additional cost when desired.

Fireproof Filing Safes

These embody the same materials and construction as the regular safes, differing only as to interior arrangement. Interior equipment is of metal and is based on the unit system, the various units being interchangeable.

Catalog showing all types and sizes sent upon request.

Steel Money Chests

For bank use and for placing in standard fireproof safes and filing safes for protection of money, bonds, jewelry, etc., wherever burglary protection is required. Regularly made with rectangular and round doors in 5 sizes from $14 \times 17\frac{1}{2} \times 15$ in. to $24 \times 24 \times 24$ in.

Constructed of alternate layers of open hearth steel plates, torch resisting plates and drillproof chrome steel plates. Ball bearing hinges and high grade bank combination locks. Finished in green enamel, striped in gold; combination dial black with white numbers; hinges and bolt work heavily nickeled.

SPECIMEN PLAN ILLUSTRATING MODERN METHOD OF BRICK CONSTRUCTION FOR FIRE-PROOF VAULTS

SPECIMEN PLAN ILLUSTRATING MODERN METHOD OF CONCRETE CONSTRUCTION FOR FIRE-PROOF VAULTS:

This latest type of wall safe is used extensively in apartment houses, dwellings and offices, due to its special feature of fastening directly on the room walls and removing same when vacating with no destruction to walls. It can be anchored or stone walls during its construction or

an opening left and safe grouted in later. May also be placed in the floor under carpets (for secrecy) with no obstruction whatever when walked upon. These safes are constructed of heavy double gauge steel all around, including back, with a monolithic insulation between, making all walls and door solid 1½ in. thick. Doors hung on concealed hinge pins and checked by a regular safe combination lock having innumerable changes in its combination. A shelf divides the safe into two compartments.

FIREPROOF SAFES, Underwriters' Laboratories, Inc., Class "A" and Class "B" Label; BURGLARPROOF BANK and SAFE DEPOSIT VAULTS; FIREPROOF VAULT DOORS; VAULT EQUIPMENTS.

Also manufacturers of Filing Devices; Safe Deposit Boxes; Steel Lined Safe Deposit Safes for hotels and clubs; Silver Safes and Special Safes and Vaults for residences; Burglarproof Chests, Messenger Boxes, etc.

Fireproof Safes

The greatest possible structural strength is built into these safes. Angles and panel bars are of heavy steel and are fully welded together.

The insulation is of monolithic type and its engagement with the outer and inner walls of the safes is such as to consolidate strength and maximum heat resistivity. Perfect engagement of the doors with the safe structure is assured through pressed steel jambs with interlocking tongues and grooves supplemented with interlocking rear flanges. A patent strip seals the entire joint between the jamb and the rear flange of the doors. The doors are hung on ball bearing hinges. Heavy round steel locking bolts and their related connections are fully insulated from the face of the door. The combination lock is protected with a chrome steel drillproof plate. All safes are equipped with adjustable filing devices installed in accordance with specific requirements.

A selection of fifteen sizes is provided in the Class "A" safes and twelve sizes in the Class "B" safes, ranging from 38½ cu. ft. to 1¼ cu. ft. in capacity.

Standard finish is olive green.

Class A Fireproof Safe No. 4030

Outside, 58 in. high, 40½ in. wide, 30 in. deep. Inside, 40 in. high, 30½ in. wide, 19¼ in. deep
